APPENDICES

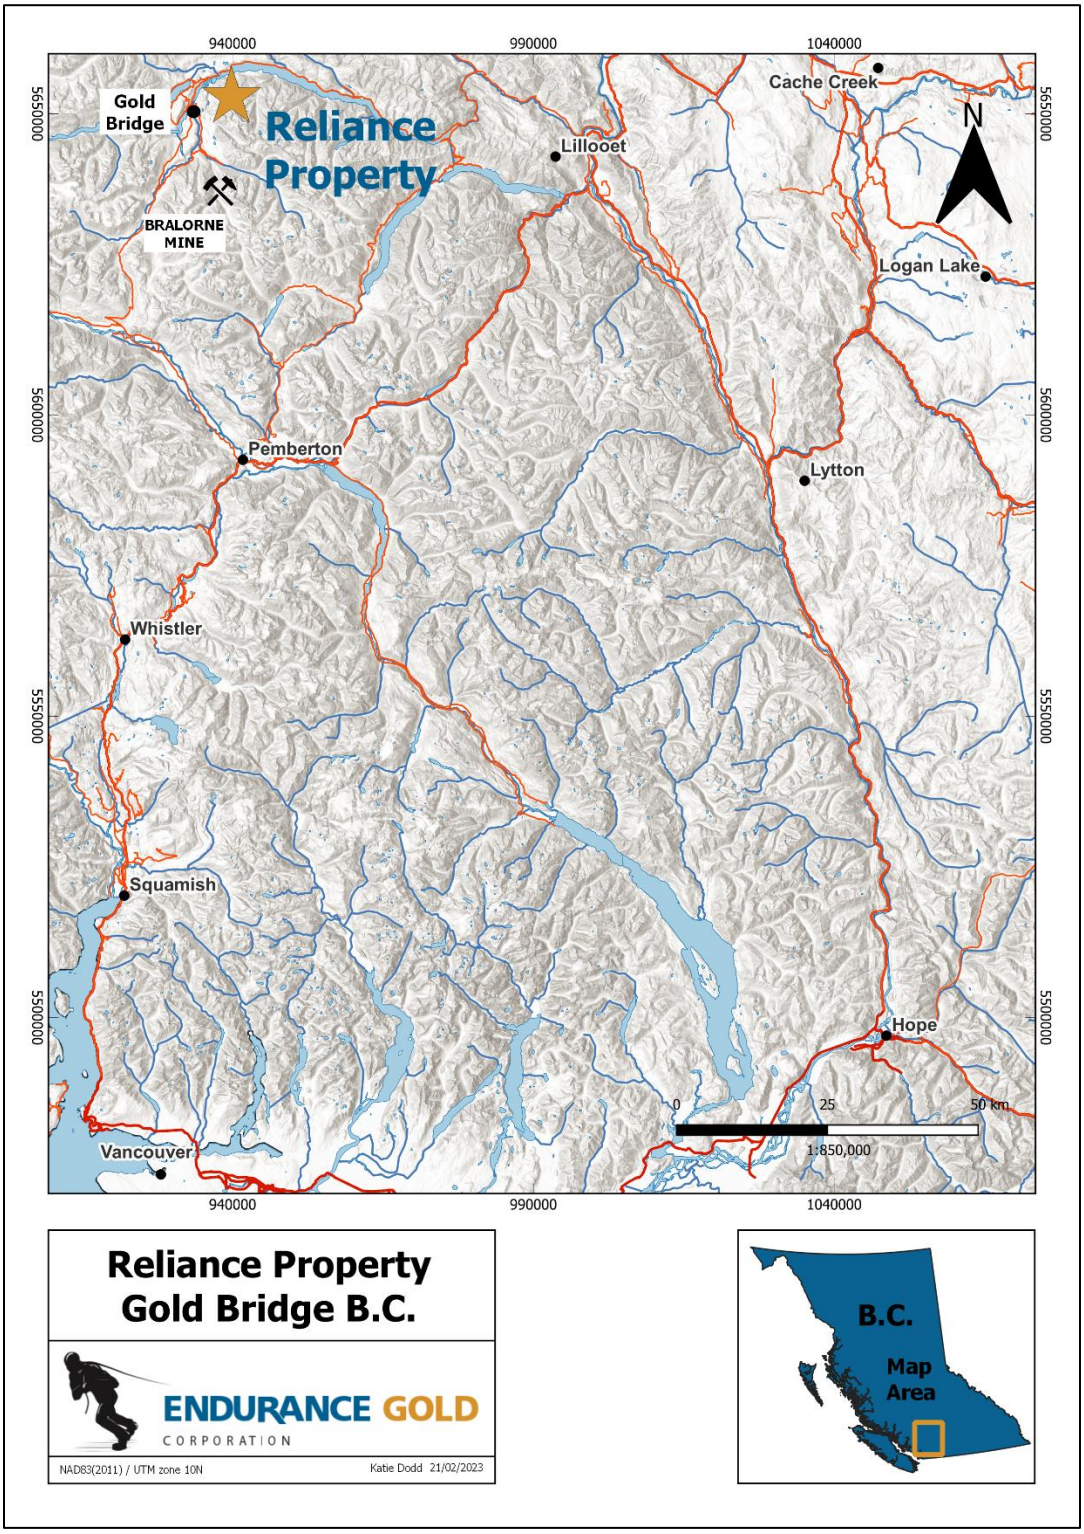
1 INTRODUCTION

In 2023, Endurance Gold (the "Company" or "Endurance") completed a geochemical survey on the Olympic and Sanchez claims of its Reliance Gold Project (the "Project" or "Reliance"). Reliance is a road accessible project that is 4 km east of the village of Gold Bridge, BC in the Bridge River Valley on the south side of the Carpenter Lake Reservoir. The Olympic and Sanchez claims (the "Olympic-Sanchez") are located 8 km and 12 km, respectively, from Gold Bridge. In 2022 the Company acquired the option to earn a 100% ownership of the Olympic-Sanchez mineral claims from separate underlying property vendors to expand the Reliance Gold Project. The Company has been exploring the Reliance since 2020 and the Project is now a contiguous 3445.5 ha land package of mineral claims and Crown Grants.

Soil and rock sampling geochemical programs were conducted on the Olympic-Sanchez claims during the 2023 field season to expand upon previous sampling conducted during the 2022 season. The field sampling occurred from May 2 to July 15, 2023 with sampling crews supplied by Tripoint Geological, Tsal'alh Development Corp (TDC), and the Bridge River Band (Xwisten). A total of 893 soil samples were collected in two separate surveys. The first survey consisted of 618 talus-fines samples collected and analyzed at the Reliance project site using a portable XRF analyzer (Olympus Vanta pXRF). The second survey consisted of 275 glacial-fluvial till samples collected in a grid pattern over the Enigma Showing (the "Enigma Grid"). The Enigma Grid samples were analyzed by a weak Ionic Leach digestion technique (ALS ME-MS23). Concurrent with the soil sampling programs, samplers collected 19 rock grab samples for assay analysis (ALS Methods Au-ICP21 / ME-MS61) .

Results of the geochemical surveys have identified three geochemical anomalies that are associated with arsenic and gold in soil mineralization. The first anomaly is situated between Girl and Howe creeks, is approximately 650 metres in length, and is defined by pXRF talus-fines and rock grabs. The second anomaly is related to the Enigma Showing, 500 metres in length, and is defined by anomalous arsenic in Ionic Leach samples. The third set of discontinuous linear anomalies are sub-parallel to Howe Creek and are possibly related to contact zones of ultramafic rocks.

Figure 1. Reliance Gold Project - General Location Map



2 LOCATION, ACCESS, PHYSIOGRAPHY, INFRASTRUCTURE & CLIMATE

The Reliance Gold Project is located 4 km east of the village of Gold Bridge, B.C. in the Bridge River Valley on the south side of BC Hydro's Carpenter Lake Reservoir (Figure 1). The Project consists of 23 claims and eight (8) Crown Grants (Figure 2). The Olympic and Sanchez optioned claims are approximately 8 km and 12 km east of Gold Bridge, respectively (Figure 3). The contiguous land package covers 3445.5 ha and extends north across Carpenter Lake Reservoir to include the historic Minto Mine. The Project is now geographically centred at 50° 52" north latitude and 122° 44" west longitude, the 1:50k NTS map index is 092J/15 and the 1:20k BCGS index is 092J/087. The camp laydown area remains near the outlet of McDonald Creek and is located at 514,615m E /5,636,465m N (NAD83 Zone 10N).

Road access to the majority of the Project claims and site of the 2023 geochemical sampling program is via the Grey Rock Forest Service Road located just east of Gold Bridge. The road begins at Sucker Creek and travels along the south side of BC Hydro's Carpenter Lake Reservoir. Access to the Project starts at the 4 km marker, where a series of logging roads and bush roads provide four-wheel drive or ATV access to the Reliance claims. Continuing east along Grey Rock Road to the 8.5 km mark, there is a turn off to the logging roads that access the Olympic claims. Access to the Sanchez claims is located at 13 km along Grey Rock Road.

The portion of the Olympic option located on the northern side of Carpenter Lake Reservoir is accessible via Lillooet Pioneer Road 40, which is the main year-round access road between Gold Bridge and Lillooet. The Tyaughton Lake Road turn-off, 12 km east of Gold Bridge, provides access to the Mowson Pond Recreation Site and the trail network to the historic Minto Mine workings.

Gold Bridge is a 100 km drive on all season roads (Lillooet Pioneer Road 40) from Lillooet, B.C. where there is access to the provincial highway system as well as the CN rail line. Lillooet to Vancouver is a 250 km drive via Highway 99 (Duffy Lake Road), or a 320 km drive via Highway 1 and the Fraser River canyon. Alternate all-season access to the south through Pemberton is via the Seton Portage Road which crosses BC Hydro's Terzaghi Dam, 55 km east of Gold Bridge at the downstream terminus of the Carpenter Lake Reservoir and then along the Highline Road from Seton Portage to Pemberton for 75 km. At this point Pemberton to Vancouver is a 150 km drive via Highway 99. Late spring to early fall seasonal road access is also possible via the Hurley Forest Service Road from Pemberton to Gold Bridge for 80 km. All roads in the region cross through very steep country which is subject to avalanches, landslides, and washouts, particularly in the spring, resulting in road closures.

There are limited facilities in the nearby communities of Gold Bridge and Bralorne; both villages have populations of less than 100 residents. Facilities include three small hotels, two restaurants, a self-serve gas bar, a small grocery store, a post office, an elementary school and a BC Hydro power generating facility. There is no cell phone service, but internet service is available. The nearest power line and water sources are 4 km from the property at Gold Bridge. The BC Hydro power generating station is located 5 km from the property at the La Joie Dam. Lillooet and Pemberton are both larger towns and can provide the necessary services to operate an exploration project.

The climate is moderately dry, as the property is located in a rain shadow area of the Coast Mountain range. Summer daily maximum temperatures can be around 25°C. Precipitation increases in the winter and daily average highs are typically around 0°C. Snow cover accumulates from early November and typically lasts until early May. Snow accumulation varies greatly depending on elevation. Advanced exploration activities such as diamond drilling can be operated on a year-round basis at the lower elevations.

Topography varies from 650 m at the Carpenter Lake Reservoir to 2590 m at the south end of the Project, lying along the slope of Truax Mountain. The highest peak on Truax Mountain is 2880 m and is located south of the property. Main drainages on the claims include McDonald, Steep and Camp Creeks on the Reliance option; Girl and Howe (aka “Marquis”) Creeks on the Olympic option; and Truax Creek, which drains the southeastern corner of the Sanchez option. All drainages flow into the Bridge River Valley and the Carpenter Lake Reservoir.

Vegetation below 1500 m elevation consists of black spruce, Douglas fir, lodgepole pine, aspen, vine maple, willow and birch trees with soapberries, wild raspberries, thimbleberry, Oregon grape, rose and various grasses. South facing slopes on and around the Minto Mine are sparsely forested. Cottonwood and devils club are evident along Steep Creek on the south side of the reservoir. Historic and recent logging has occurred at lower elevations where private woodlots are registered. Open alpine is above 1500 m elevation.

3 LAND TENURE AND CLAIM STATUS

The Reliance Gold Project consists of 23 Mineral Titles Online ("MTO cell") mineral claims and eight (8) Crown Grants with subsurface mineral rights. Endurance Gold is the operator of the Project and has the rights to acquire 100% ownership of all claims via three separate option agreements. The total property encompasses 3445.5 hectares.

The "MTO cell" claims and are located online by Universal Transverse Mercator map projection coordinates (UTM NAD83 Zone 10) for the northeast corner of each cell unit. The MTO cell claims require annual exploration and development work which must be registered within one year of the work being completed. The required work value is dependent upon the age of the mineral claims and increases as per the schedule below:

First and second anniversary years	$5.00 per hectare per year
Third and fourth anniversary years	$10.00 per hectare per year
Fifth and sixth anniversary year	$15.00 per hectare per year
Subsequent anniversary years	$20.00 per hectare per year

Mineral claims allow the holder certain rights to exploitation of subsurface minerals only, and no rights to surface commodities are implied by the Province of British Columbia.

In September 2019 the Company entered into an option agreement to acquire 100% interest in four (4) mineral claims in two non-contiguous blocks. The claim ownership is 50% by client 116838 David George Mark, and 50% by client 137790 Ana Ruth Simpson. The option is subject to a 2.5% net smelter return royalty ("NSR"), of which 1.5% NSR can be purchased by the Company at any time for $1,000,000.

In May of 2022, Endurance Gold Corporation expanded the Reliance Gold Project by acquiring an option to earn a 100% ownership in the former Minto Gold Mine and the Olympic and Kelvin gold prospects contained within a parcel of crown grants and mineral claims (the "Olympic Option"). The Olympic claims are contiguous with Endurance's previously optioned claims. The Olympic claims are owned by Avino Silver & Gold Mines Ltd. ("Avino") and are located on the north and south shores of BC Hydro's Carpenter Lake Reservoir. Under the terms of the option agreement, the Olympic claims will be subject to a 2% NSR royalty to Avino, of which 1% NSR can be purchased by the Company for $750,000 and the remaining balance of the NSR can be purchased for $1,000,000.

In October of 2022, the Reliance Gold Project was further expanded by an option to earn a 100% ownership in the Sanchez Group of ten mineral claims totaling 856 hectares. These claims adjoin the eastern boundary of the Olympic claims.

In 2020 and 2022, Endurance Gold acquired two additional mineral claims that are not subject to any underlying option agreements or royalties.

Claim status for any legacy and cell claims were searched on the BC Mineral Titles Online (MTO) website and is provided in Table 1. All claims are indicated to be in good standing until at least August 23, 2033.

The Project includes eight (8) crown grants for 111.58 hectares where Avino owns the subsurface mineral rights. There are no surface rights. These crown grants are included in the Olympic Option agreement. No annual work expenditures are required for crown grants. The crown grants are listed in Table 2.

Claim shapefiles used to create Figure 2 and Figure 3 were downloaded from the DataBC website (https://data.gov.bc.ca/).

4 EXPLORATION HISTORY

4.1 Olympic Claims

The following is a property summary sourced from C. Sampson (2006) detailing the exploration history of the area covered by the current Olympic claims:

The Bridge River camp has been the most significant lode gold producing district in B.C. Initial discoveries of placer gold were made in 1863 and by the end of the nineteenth century many of the veins which were to become producers in the twenties and thirties had been discovered.

Prior to 1930, the Minto claims on the north side of Carpenter Lake Reservoir were held as a prospect for many years, and some surface work had been carried out on a weathered shear zone up to eight feet wide exposed largely on the Omega 1 claim on the north shore of Carpenter Lake. Cominco then optioned the property in 1930 and drove an adit 350 ft (107 m) north into the hillside at the river (lake) level (also referred to as the 400-foot level).

Following the termination of Cominco's option in 1933, Minto Gold Mines Ltd. opened a small mining operation, eventually processing up to 125 tons per day ('tpd') from five levels (MMBC 1937). Between 1934 and 1940 when work ceased, 88,900 tons of ore were mined to produce 17,558 ounces Au (0.20 oz/t recovered), 50,584 ounces Ag (0.57 oz/t recovered), and 21,327 pounds ('lbs') of copper and 124,421 lbs of lead. The concentrate was shipped to Tacoma for smelting. The workings extended a maximum of 400 m north (1300 ft) along the mineralized structure on 200 the level, of which about 160 m (530 feet) constituted ore grade. The workings extended to the 700 level.

Pioneer Gold Mines Ltd. optioned the Minto group briefly in 1941. In 1944 and 1945, the B.C. Minister of Mines reported that 14 diamond drill holes (3954 ft) had been completed on surface and underground searching for strike and dip extensions of the Minto ore body. Results were reported to be not encouraging. Ace Mining Co. Ltd. acquired the ground in 1959 but performed little work. In 1975, Empire Metals Ltd. optioned the claims and are thought to have carried out geochemical and geophysical surveys, although results are not available.

Avino Mines and Resources Ltd., (predecessor to Avino Silver & Gold Mines Ltd.) purchased a 100% interest in the Minto property early in 1985. During 1985, geological, geochemical, and geophysical (VLF-EM) surveys were conducted, and trenches were excavated in anomalous areas. In-fill soil geochemistry and further trenching were undertaken in 1987 (Christoffersen, 1988).

The Olympic property on the south side of Carpenter Lake Reservoir originally comprised the Olympic and Kelvin Claim groups, operated by Olympic Gold Mines Ltd. and Kelvin Gold Mines Ltd, respectively.

The Bridge adit was driven on the Patnor claim by the Mintonia Mining Syndicate in 1933-1934. Kelvin Gold Mines Ltd was incorporated in late 1934 to continue development (O'Grady, Special Report 1936 p 65).

The Leckie and Magee adits were driven on the Alta #1 Claim some 90 m each (300 ft) by Olympic Gold Mines Ltd. between 1934 and 1937 on a steep gold-bearing shear zone striking SE (MMBC-1937 Annual Report). Both adits are now caved. Gold grades were reported in the range 0.01-0.12 oz/t with 0.6-6.5 oz/t Ag, 1.7-2.5% Zn., 0.3% Cu and 1% Pb over widths of 1.5-4 m (5-13 ft). During the same period the company drove an adit 46 m (150 ft) SE on the Billyo massive magnetite-pyrrhotite-pyrite zone and encountered low-grade gold, silver and copper over widths up to 9 m (30 ft). On the Antimony (No.1) Zone a 41 m (135 ft) adit was opened on a quartz-stibnite vein striking SE-NW and dipping 45 degrees NE.

Further work was undertaken on the Leckie structure in 1945-46 when a 26 m (85 ft) winze was sunk, and nine surface and underground diamond drill holes were completed; assay results are not known (BCDM-1945 p88). During the late 1940's, it is reported that the two short adits, referred to as the Manner's adits, were driven.

Kelvin Gold Mines Ltd. operated the Alma, Bridge and Kelvin adits between 1933 and 1936 when the company ran out of money. The Alma workings follow a quartz-carbonate zone with some pyrrhotite and chalcopyrite, but there is very little information available. The Kelvin showing is a narrow vein within a shear zone striking SE-NW and dipping 60-85 degrees SW. Surface samples carry some high-grade gold over narrow widths (0.5 m). In the 700 ft Kelvin adit, assays ranged from 0.01-0.088 oz/t Au and trace-0.1 oz/t Ag (MMBC-1936). The Bridge adit is located below the Kelvin adit and was driven on the same vein/shear. Encouraging gold grades were reported commencing from the portal as follows:

0-105 ft – 0.40 oz/t Au over one foot width
105-160 ft – 0.23 oz/t Au over five feet width
160-275 ft – 0.29 oz/t Au over five feet width

The Olympic and Kelvin claim groups lay largely dormant after the 1940's until they were staked by D. Ingram of Lillooet in 1977. Noranda optioned the ground in 1980 and focused its attention on the Billyo Zone, where geochemistry indicated a molybdenum anomaly possibly associated with a buried intrusive body. Noranda drilled two short core holes which encountered greenstones, sediments and felsic breccias, the latter possibly being tectonized Fergusson Group cherts. Locally the core carries pyrite, but gold assayed less than 0.005 oz/t Au.

Lacana Mining Corp optioned the property in 1983-84 and carried out limited soil geochemistry and diamond drilling. Five holes in total were drilled in the Magee Zone and one hole down slope from Billyo Zone. Assays returned low gold grades.

In 1985, the E.D.B. Group, comprising Big 1 Developments and Redwood Resources, optioned the property. The group carried out soil geochemistry over part of the claims though no gold analyses were done at the geochemical level. E.D.B. also re-sampled some of the old workings at surface, confirming earlier assay results, and analyzed some of Lacana's core.

Avino Mines and Resources Ltd. (predecessor to Avino Silver & Gold Mines Ltd.) purchased 100% interest in the Olympic/Kelvin claims in June 1987. During August 1987, a soil geochemical survey covering virtually the entire property was completed (Christoffersen, January 1988).

During early 1988, Avino Mines and Resources did further geochemical soil sampling on the western half of the Minto property which located significant antimony and arsenic anomalies with associated gold and silver values (in soils). A follow-up trenching program in this area (the Jumper) discovered stibnite and arsenopyrite bearing shear zones with gold and silver values, which were exposed by nine (9) trenches and seven road cuts. A series of 1 m chip samples taken across the mineralized shears returned assay values as high as 0.349 oz/ton gold (Sampson, 1988).

In late June – early July, Avino drilled 9 NQ diamond holes totaling 800 m, of which, holes 88-1 to 88-7 explored the Minto North, and 88-8 and 88-9 explored the Winter Zones (Sampson, 2006).

In 2004, four NQ diamond drill holes totaling 287.7 m were drilled on the Olympic/Kelvin claims. Three holes were drilled in the Margarita Zone, and one in the Enigma Zone identified by trenching in 1988. The Margarita Zone drilling was plagued with difficulties due to ground conditions and all three holes were lost. The Enigma drill hole returned grades considerably lower than those encountered in surface trenching (Dunn, 2004).

In 2005, trenching and drilling was conducted on the Minto and Olympic Claims. Two NQ diameter core holes were drilled on the Jumper or Golden Zone on Minto property totaling 254.3 m, three NQ diameter core holes were drilled on the Minto North Zone on Minto property totaling 304.5 m, and five NQ diameter holes were drilled on the Kelvin Zone (Olympic property) totaling 314.99 m (Sampson 2006). No work has been filed on the claim block since 2006.

4.2 Sanchez Claims

Very little work has been filed on the area covered by the current Sanchez claims. In 1987, La Ronge Resources filed a report on behalf of the owner, Golden Dragon Resources, on the Bill Miner's claim group, which covers what is today the northern part of the Sanchez claims and overlaps on the western side with what is today the Olympic claims. It states that although there is no record of previous work, two short adits and several trenches were found (Dispirito, 1987).

The 1987 program consisted of 65 soil samples along four lines and 13 rock samples. Rock samples around adit one were anomalous for gold, while the soil samples around adit two were more anomalous. A systematic exploration of the property was recommended.

Table 3. Olympic and Sanchez Properties – Historic Work Summary

Operator	Year	Geochemistry	Geophysics	Trenching and Drilling	Mapping	Author/ARIS No.
Olympic Claims*						
Noranda Exploration	1980	167 soils	8.8-line km VLF and Mag survey over soil grid			Lewis, 8293
Noranda Exploration	1980			2 BQ DDH, 265.78 m		Lewis, 8954
Mr. and Mrs. D.B. Ingram	1983	42 rocks, and soils				Price, 11139
Lacana Mining Corp	1984	217 soils				Johnson, 12124
Mr. D.B. Ingram and Mr. B.J. Price	1984	17 rocks	1320m VLF-EM survey and geological mapping			Price, 12276

5 GEOLOGY

Geological setting and mineralization are modified after C. Hart and R. Goldfarb (2017), and J. Oliver (2020) and O'Brien (2021):

5.1 Regional Geology & Mineralization

The Reliance Gold Project is located within the Bridge River mining district in southwestern British Columbia. The district is the largest historical gold producer in the Canadian Cordillera with more than 128 tonnes (4.1 million ounces) of gold production between 1897 and 1971 (Church, 1996). Most production came from the Bralorne-Pioneer vein system that yielded approximately 7 million tonnes averaging 19.1 g/t (0.58 oz/t) Au (Leitch, 1990).

The Bridge River district is a northwest-trending, structurally complex region along the western margins of the Intermontane Terranes, adjacent to variable intrusive contacts of the plutonic rocks from the southeastern Coast Plutonic Complex to the west. In this region, the Intermontane Terranes consist of structurally interleaved Mississippian to Middle Jurassic Bridge River Terrane accretionary complex, structurally juxtaposed against Late Triassic to Early Jurassic Cadwallader Terrane volcanic rocks and arc-marginal clastic strata. The region was subsequently intruded and overlain by a wide range of Cretaceous and Tertiary magmas and lavas that form the plutonic and volcanic rocks related to the Coast Plutonic Complex.

The Bridge River Terrane is primarily Mississippian to Middle Jurassic pillowed and massive oceanic basalts, with lesser ribbon chert, shale, argillite and limestone. Locally there are slivers of serpentinite.

The Cadwallader Terrane includes mafic-arc tholeiitic volcanic rocks (Pioneer Formation) that are overlain by a thick sequence of Lower and Middle Jurassic Hurley Formation siltstone, sandstone and conglomerate.

The Coast Plutonic Complex is a region underlain by a mostly contiguous and diverse array of granitoid bodies, comprising mid-Cretaceous and older, mid-crustal plutons and batholiths, with contact-metamorphosed country rock pendants indicating intrusion into older, mostly Cadwallader Terrane basement. Notable among the definable plutonic bodies is the Late Cretaceous to Eocene Dickson-McClure batholith, the Bendor batholiths and the Eldorado pluton.

The geology of the district is characterized by significant deformation, and the most significant event was the amalgamation of the Bridge River accretionary complex. These rocks yield ca. 230 Ma Ar-Ar ages on white mica and indicate that subduction related deformation occurred during the late Middle Triassic and may have continued into the Middle Jurassic (Schiarizza et al., 1997).

Subsequently, the region was widely affected by mid-Cretaceous contractional deformation that emplaced the westerly-verging Shulaps ultramafic complex above Cadwallader and Bridge River terranes. The timing of this deformation and related low-grade metamorphism is ca. 130 to 92 Ma (Garver et al., 1989; Schiarizza et al., 1997). Much of the Bralorne-Pioneer vein system occurs along or within these

structures, and early, Late Cretaceous sinistral movements on the Eldorado fault and the Castle Pass fault system are considered to be coeval with final regional contraction (Schiarizza et al., 1997).

Younger, northwest-trending dextral strike-slip displacements reactivated many of the older faults, particularly the Marshall Creek and Yalakom faults east of the Bralorne district. Dextral deformation is best estimated as having been initiated at or slightly before 67 Ma and is considered a primary control on much of the mineralization proximal to the faults in these areas (Schiarizza et al., 1997).

Figure 5. Regional Geological Setting of the Bridge River Mining District; Modified after Hart and Goldfarb (2017).

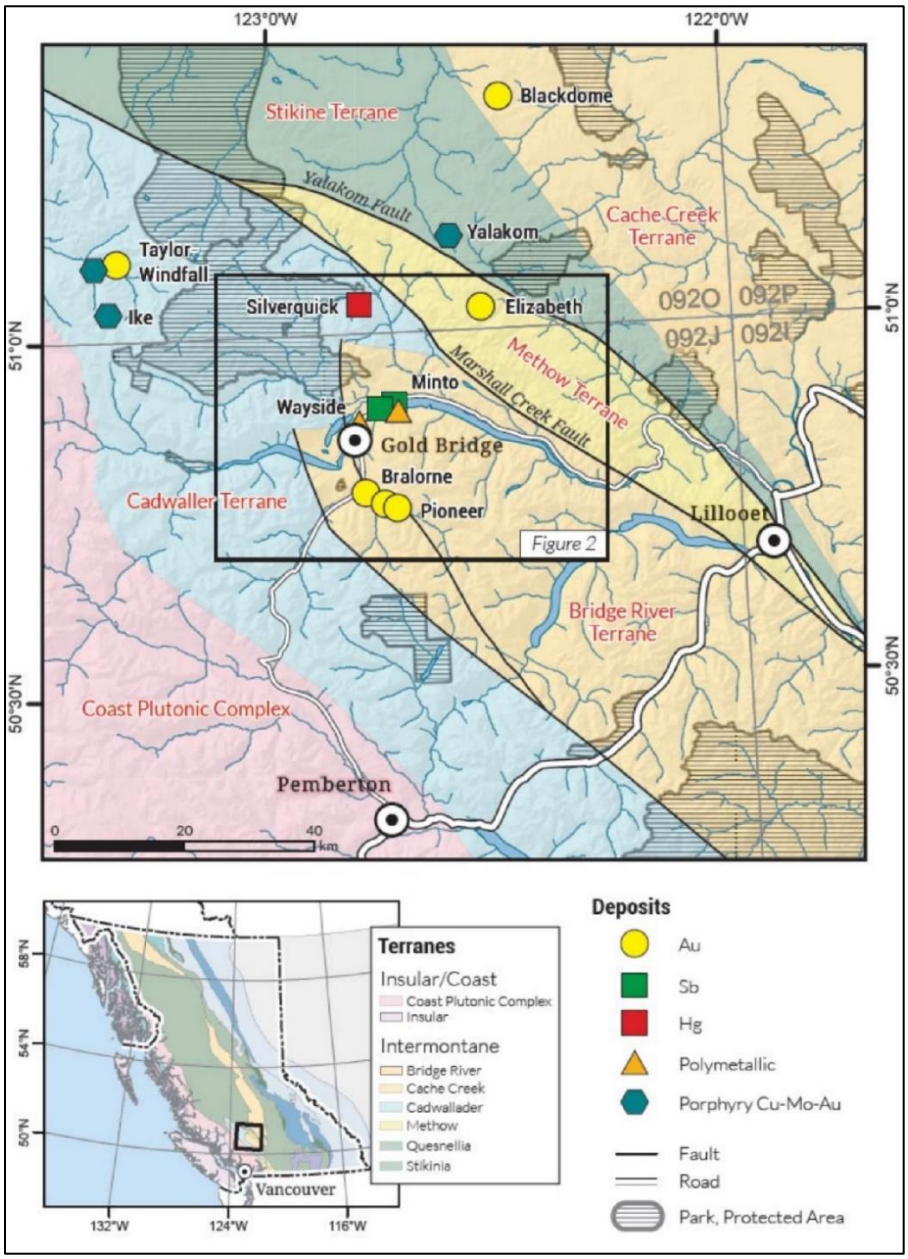

Figure 6. Regional Geological Setting of the Bridge River Mining District Showing Distribution of Mineral Deposits; Modified after Hart and Goldfarb (2017).

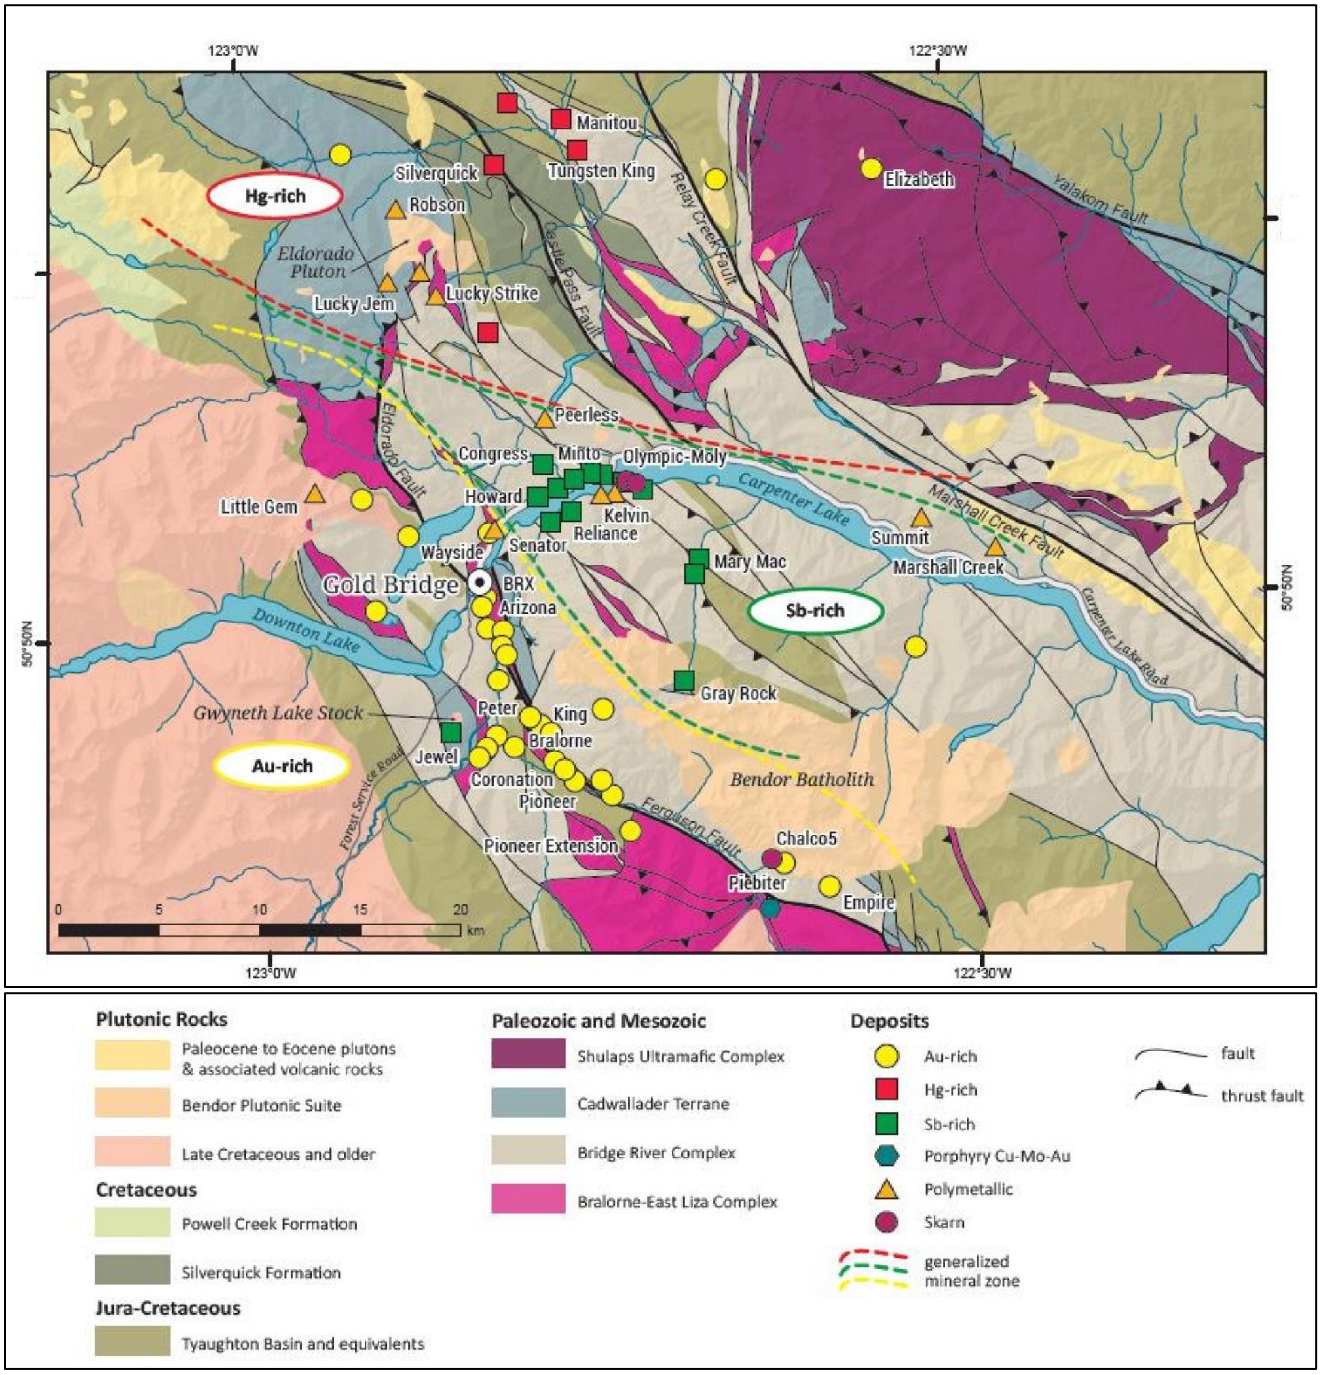


5.2 Property Geology and Mineralization

Much of the Reliance Gold Project is overlain by either unconsolidated glacial tills or by post glacial, white volcanic tephra ash. Tills are non-stratified, coarse boulder to cobble sized with a sandy matrix. Till thickness appears to be increasing in the western portion of the property where road cuts indicate that greater than 5 m of coarse boulder-cobble tills are common.

Most till exposures are overlain by post glacial white ash deposits of the Bridge River Ash formation. These deposits are variable in thickness ranging from a few 10's of cm to greater than a metre. They are bone white in color, felsic in composition and locally may contain black vitric pumice fragments. The ashes have been derived from Plinth Peak, located 53 km to the west northwest of Gold Bridge, and are Pliocene (2350 years) age (Schiarizza et al., 1997).

Bedrock lithologic units present on the Reliance Gold property are interpreted to belong to the Mississippian to Middle Jurassic Bridge River Terrane and include (1) mafic flows and pillowed massive flows (upper and lower sequences), (2) interbedded fine-grained argillites and ribbon banded cherts, (3) hematitic siliceous siltstones-cherts, (4) polylithic volcanic breccias, (5) limestone-marbles and (6) quartzite.

Intrusive units on the property include (7) hornblende and plagioclase phyric diorites, (8) feldspar porphyritic dykes and (9) gabbro-diorites. No age dating has been completed on the Reliance Gold intrusives and the current assumption is that they may be related to the nearby Late Cretaceous Bendor Plutonic Suite (Oliver 2020). Age dating within the Bridge River Camp has been summarized by Hart and Goldfarb, 2017, Table 2.

Alteration outcrop mapping on the Reliance claims has identified six principle alteration domains including post alteration tufa deposits, weak sericite-chlorite-hematite, weak ankerite, moderate ankerite, moderate to strong ankerite-quartz and early sericite-quartz (Oliver, 2020). Systematic alteration mapping has not been conducted on the Olympic or Sanchez claims.

Two styles of gold mineralization have been identified on the property including (1) gold associated with quartz-ankerite breccia zones and quartz-ankerite shear and extensional vein arrays; and (2) gold associated with clay-sericite-hematite fault zones with weaker secondary silica (Oliver, 2020).

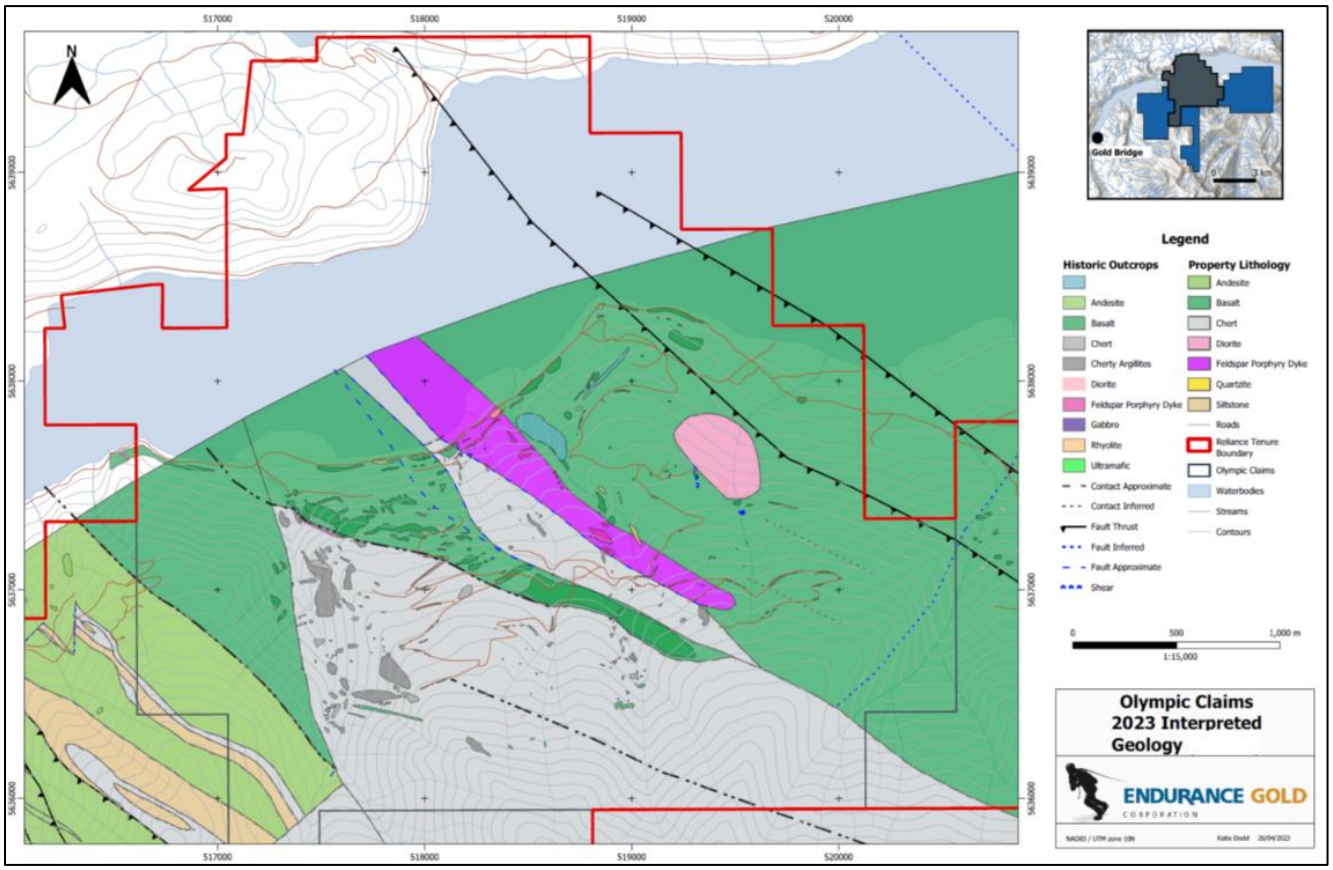
Gold mineralization in the Reliance property drilling appears to be dominantly associated with extremely fine-grained arsenopyrite (<30 microns) that is most closely associated with iron-carbonate alteration of volcanic wall rock, and carbonate +/-quartz veinlets (Ross, 2022). Hackly pyrite alteration was likely peripheral and early as it is present in unmineralized rock and is overprinted by arsenopyrite and stibnite in mineralized rocks (Ross, 2022).

At the completion of the 2023 program, the Company has completed 84 RC drillholes and 82 diamond drillholes primarily in the Steep Creek area where it has defined gold mineralization for a 1,500-metre trend along the footwall of the Royal Shear Fault. Gold intersections observed in drill core is associated with intense iron-carbonate, and sericite alteration within structurally deformed sequences related to the

Royal Shear. Gold mineralization is directly related to varying amounts of pyrite, stibnite, arsenopyrite and pyrrhotite as sulphide replacement and multigenerational breccias often with associated pervasive silicification, quartz stockwork and/or quartz breccia infill. This is interpreted to represent a shallow-level (epizonal) orogenic gold system (Endurance Gold Corporation, January 25, 2022).

Endurance Gold has not completed detailed geological mapping on the Olympic or Sanchez claims but has conducted prospecting concurrent with the 2022/2023 soil geochemical programs. Figure 7 displays the Company's interpreted geology of the Olympic property based on a compilation of historic assessment reports. Outcrop mapping from the various reports were digitized into a common GIS and simplified with a common lithology legend. Select outcrops were field inspected during the soil geochemical programs which improved confidence in the historic work.

Figure 7. Olympic Claims - Interpreted Geology Map

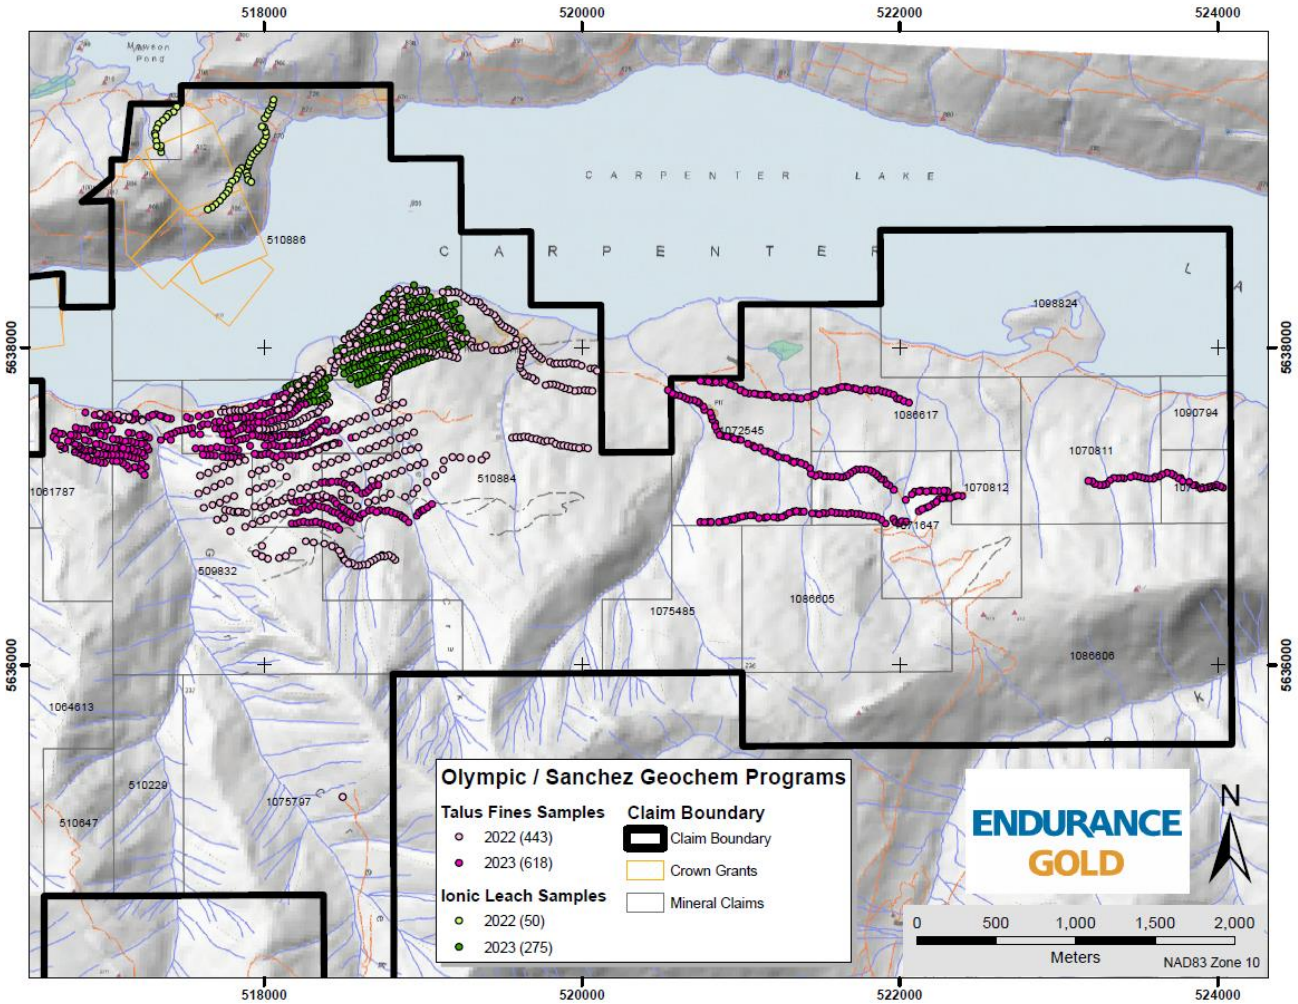


6 2023 GEOCHEMICAL PROGRAMS (OLYMPIC / SANCHEZ CLAIMS)

Soil geochemical programs were conducted on the Olympic and Sanchez claims of the Reliance Gold Project during the 2023 field season to expand upon previous sampling conducted during the 2022 season. The field sampling occurred from May 2 to July 15, 2023 with sampling crews supplied by Tripoint Geological, Tsal'alh Development Corp (TDC), and the Bridge River Band (Xwisten). A total of 893 soil samples were collected in two separate surveys. The first survey consisted of 618 talus-fines soil samples collected and analyzed at the Project site using a portable XRF analyzer (Olympus Vanta pXRF). The second survey consisted of 275 glacial-fluvial till samples and analyzed with a weak ionic leach digestion technique (ALS ME-MS23). Concurrent with the soil sampling program, samplers collected 19 rock grab samples for assay analysis (ALS Methods Au-ICP21 / ME-MS61) .

Figure 8 display talus-fines samples and ionic leach samples collected during the 2022 and 2023 field seasons.

Figure 8 2022/2023 Soil Geochem Programs



6.1 Talus-Fines – Field Collection Procedures

A 618-sample talus-fines soil sampling program was conducted during the 2023 field season on the Olympic and Sanchez claims of the Reliance Gold Project. The program was designed to follow up on encouraging results from an orientation program completed in 2022. The 2022 orientation program consisted of 443 talus-fines on the Olympic claims. Previous work completed by Endurance Gold over the Imperial and Eagle Zones has shown that pXRF analysis of talus-fines is a useful tool in detecting anomalous arsenic with a strong correlation to gold mineralization.

As a first pass traverse, soil samples were collected from roadcuts of forestry roads where the talus horizon is often exposed below the Bridge River Ash formation. These roadcut samples were collected at 25-metre intervals. Additional samples were later collected along topographic contour lines spaced 100-metres apart where initial traverse encountered any anomalous arsenic mineralization as detected by the pXRF. Contour samples were also collected at 25-metre sample intervals and samplers would dig through the ash formation to expose the talus horizon below. The ash formation is often dry, unconsolidated and over one metre thick, making it difficult to penetrate with a soil auger. Samplers have found the best method to expose the talus horizon is to dig through the ash using a spade shovel.

An example of a roadcut talus sample can be found in Figure 9. The profile shows the white-coloured ash horizon and weak 'orange' enrichment at the top of the talus horizon.

Figure 9 Typical Roadcut Talus-Fine Sample Profile

Talus samples were collected using a handheld gardening trowel. Samplers would collect the sample approximately 10 to 30 cm below the ash where there was often weak soil development and some orange colour enrichment. The talus samples were not screened in the field, but large rock pebbles and organic roots would be removed by hand prior to placing the samples in a 4" x 6" soil kraft bag. The samplers recorded observations in a paper notebook or ESRI Survey123 app, recorded GPS coordinates with a Garmin handheld, wrote the sample tag number on the kraft bag, took a photo, and finally marked the sample location with flagging tape.

At the end of the sampling day, soil sample kraft bags were organized in sequence and air dried for several days on racks in the Company's rental garage. No heat was used during the drying process.

6.2 Talus-Fines – pXRF Analysis

Talus-fines soil samples were analyzed by a Company technician at the project site using an Olympus Vanta pXRF Analyzer with a hooded docking station. The technician would screen the dried soil sample using a kitchen strainer (approximately 30 mesh) and would collect the minus-fraction in a Ziplock "sandwich" bag. The over-size material was returned to the kraft bag. See Figure 10.

The Ziplock bag with the minus-fraction is placed in the pXRF docking station and analyzed for 60 seconds using the Reflex Connect software package. The software would record ppm-level concentrations for 37 different elements. Quality control (QC) checks on the pXRF unit were preformed at preprogrammed intervals using blank and Cu standard powder pucks provided with the unit. Standard deviations were also collected allowing for QC analysis. The Reflex Connect database was exported to Excel csv files on a periodic basis.

After the Ziplock bag was analyzed, it was placed back into the kraft bag with the over-size material. This allows the ability to combine both size fractions at a later date if desired to send to a lab for ICP analysis. The Excel csv export files were merged with the field descriptions to create the final soil database for statistical analysis and ArcGIS shapefile creation.

Figure 10 pXRF Analysis of Talus-Fines

6.3 Talus-Fines – Results

The results discussed herein are inclusive of both the 2022 soil traverse and the 2023 soil infill programs conducted on the Olympic and Sanchez claims. The primary objective of these programs was to collect talus-fines soil samples for pXRF analysis to determine arsenic concentrations. Previous work by Endurance Gold has shown that the Olympus Vanta pXRF Analyzer reports a reproducible arsenic value and that arsenic is a key pathfinder element for gold exploration in the Bridge River Camp.

Although studying arsenic concentrations was the primary objective of this study, the pXRF also reports a suite of different elements. Histograms and scatterplots were created to determine which elements have quantifiable results as reported by the pXRF. A subset of 37 elements were determined to be relevant for statistical analysis and they were studied to determine if they could be used to identify lithology signatures or alteration zonation. The other elements were deemed unreliable primarily due to the high number of 'less than detection' results.

Sample descriptions with pXRF results can be found in Appendix C.

6.3.1 pXRF Arsenic

Arsenic is a known pathfinder for gold mineralization in the Bridge River Camp and the pXRF analyzer reports a quantifiable arsenic concentration. For the Olympic/Sanchez soil sampling programs the pXRF reported arsenic with a maximum value of 3,364 ppm, a minimum of zero ppm, with a median of 36 ppm and mean of 76 ppm. The arsenic distribution produces a smooth, positively skewed histogram showing arsenic enrichment and outliers greater than 500 ppm (see Figure 11).

Figure 11 Arsenic Histogram (pXRF Talus Fines)

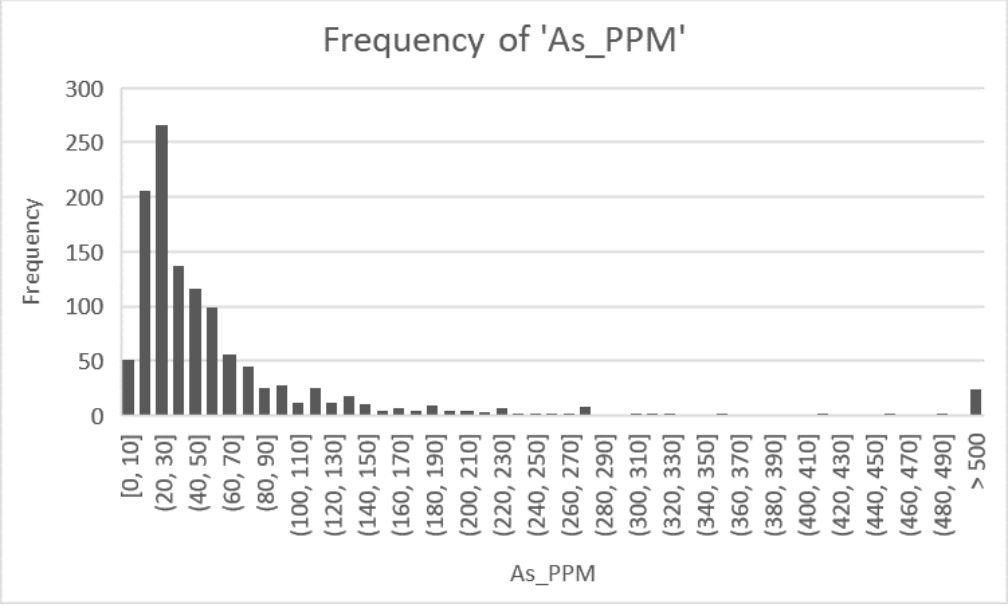


Figure 12 shows a gridded arsenic concentration map and all the sample points for the combined 2022/2023 Olympic and Sanchez programs.

Figure 12 Combined 2022/2023 Talus-Fines Map (Gridded Arsenic)

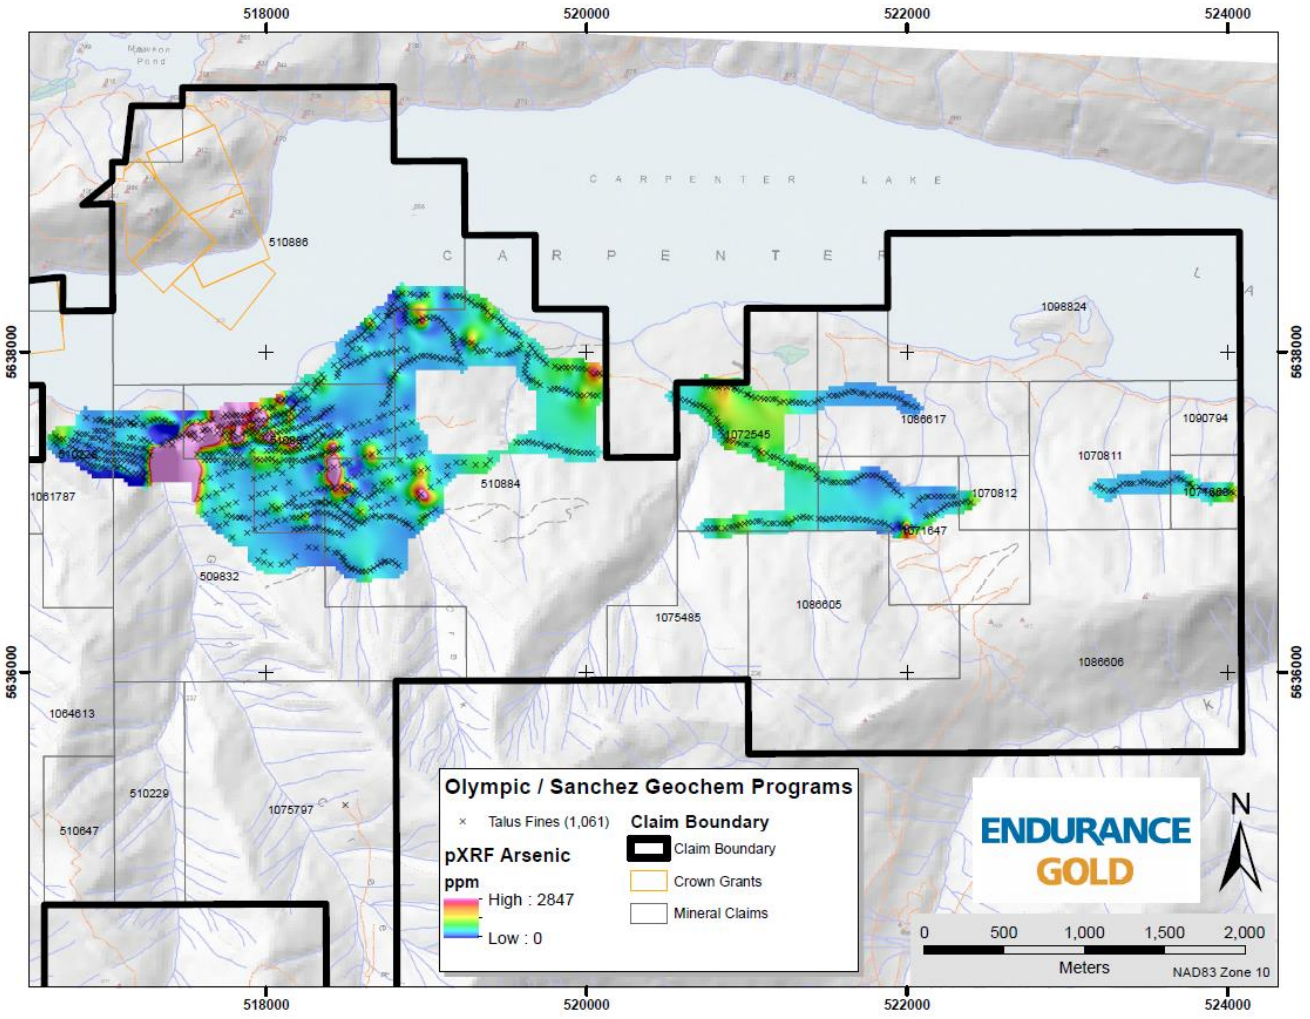

Figure 13 and Figure 14 are a more detailed view of the Olympic claims where infill soil lines where added and a 500-metre long 'arsenic-in-soi' anomaly was identified between Girl and Howe creeks.

A series of detailed geochemical maps plotting arsenic values for each individual sample can be found in Appendix I.

Figure 13 Olympic Grid - pXRF Arsenic-in-Soil Anomaly

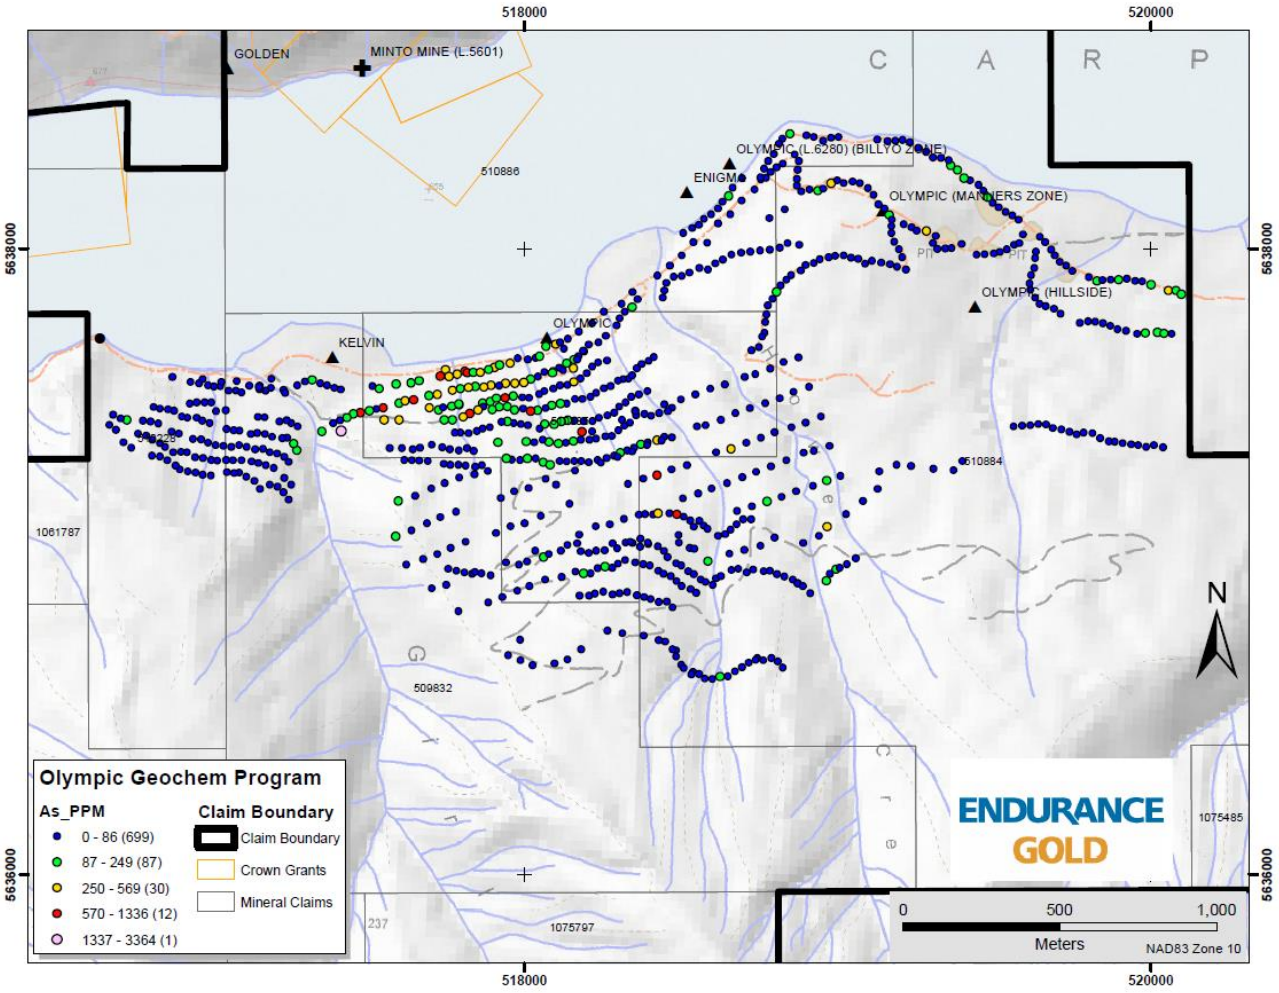

Figure 14 Olympic Grid - pXRF Gridded Arsenic-in-Soil Anomaly

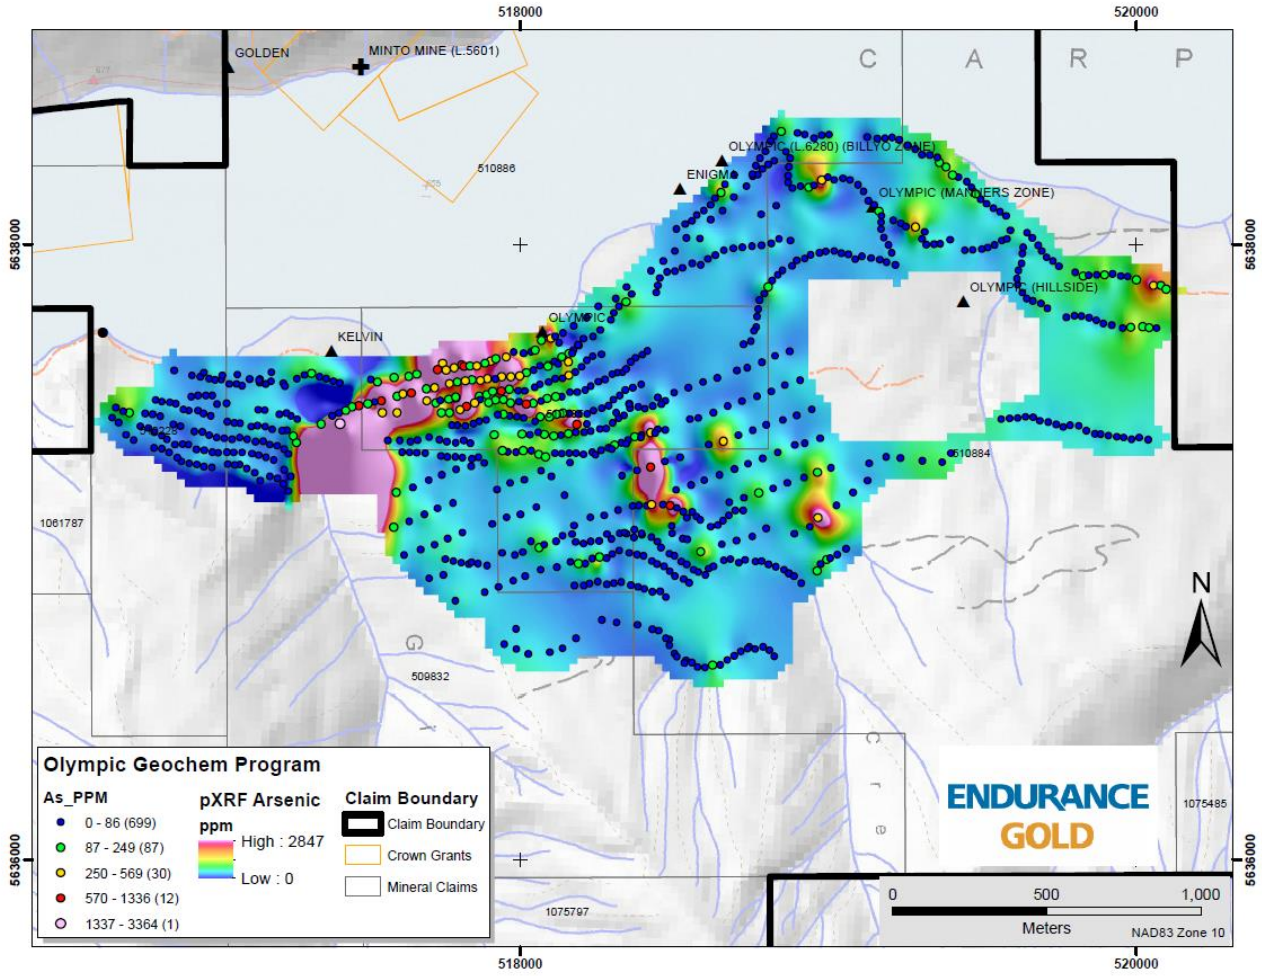
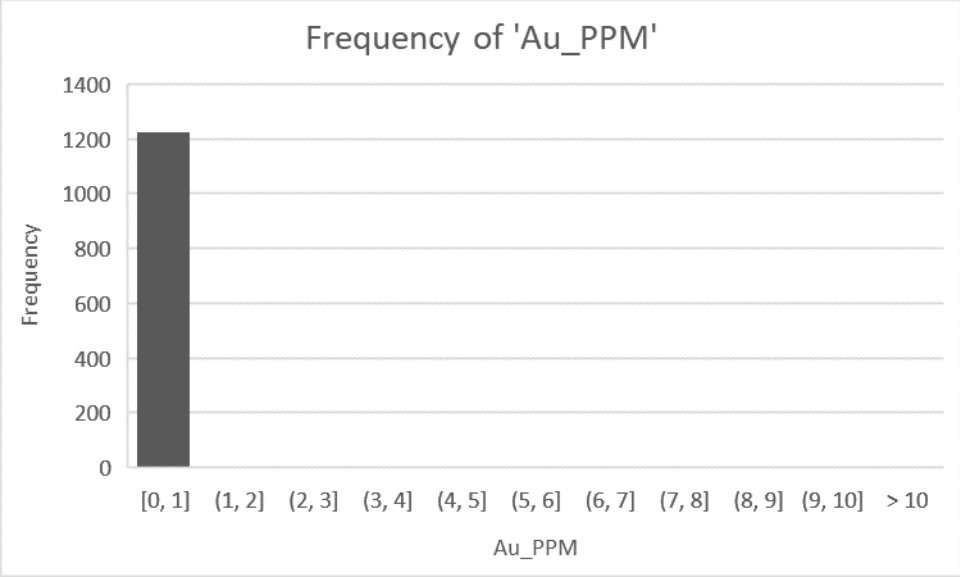


6.3.2 pXRF Gold

The Olympus pXRF unit does not measure gold quantitatively and typically returns “less than detection”. The Company has measured several thousand pXRF readings of Reverse Circulation (“RC”) drilling chip samples and talus-fine soil samples from the Reliance Project and has shown that the Olympus Vanta pXRF unit will occasionally return a numeric gold value where arsenic is typically greater than 500 ppm. The numeric gold value is not accurate and is typically multiple times greater than the true gold value, but it is usually an indication that gold is present in the sample.

For the 2023 talus-fines survey, only one sample returned a numeric gold value. Sample L638503 returned 69 ppm gold and 3,364 ppm arsenic, which is also the highest arsenic value analyzed to date. A histogram of gold is shown in Figure 15. All of the other samples return a less than detection value and were assigned a value of zero in the pXRF database.

Figure 15 Gold Histogram (pXRF Talus-Fines)



6.3.3 pXRF Other Elements of Interest

Although analyzing arsenic concentrations was the primary objective of this study, the pXRF also reports a suite of different elements. Histograms and scatterplots were created to investigate which elements have quantifiable distributions as reported by the pXRF, and a correlation matrix was created in Microsoft Excel to investigate any multi-element correlations (see Appendix C). A subset of 37 elements were determined to be relevant for statistical analysis and they were studied to determine if they could be used to identify lithology signatures or alteration zonation. The other elements were deemed unreliable primarily due to the high number of 'less than detection' results and/or lack of grade variability.

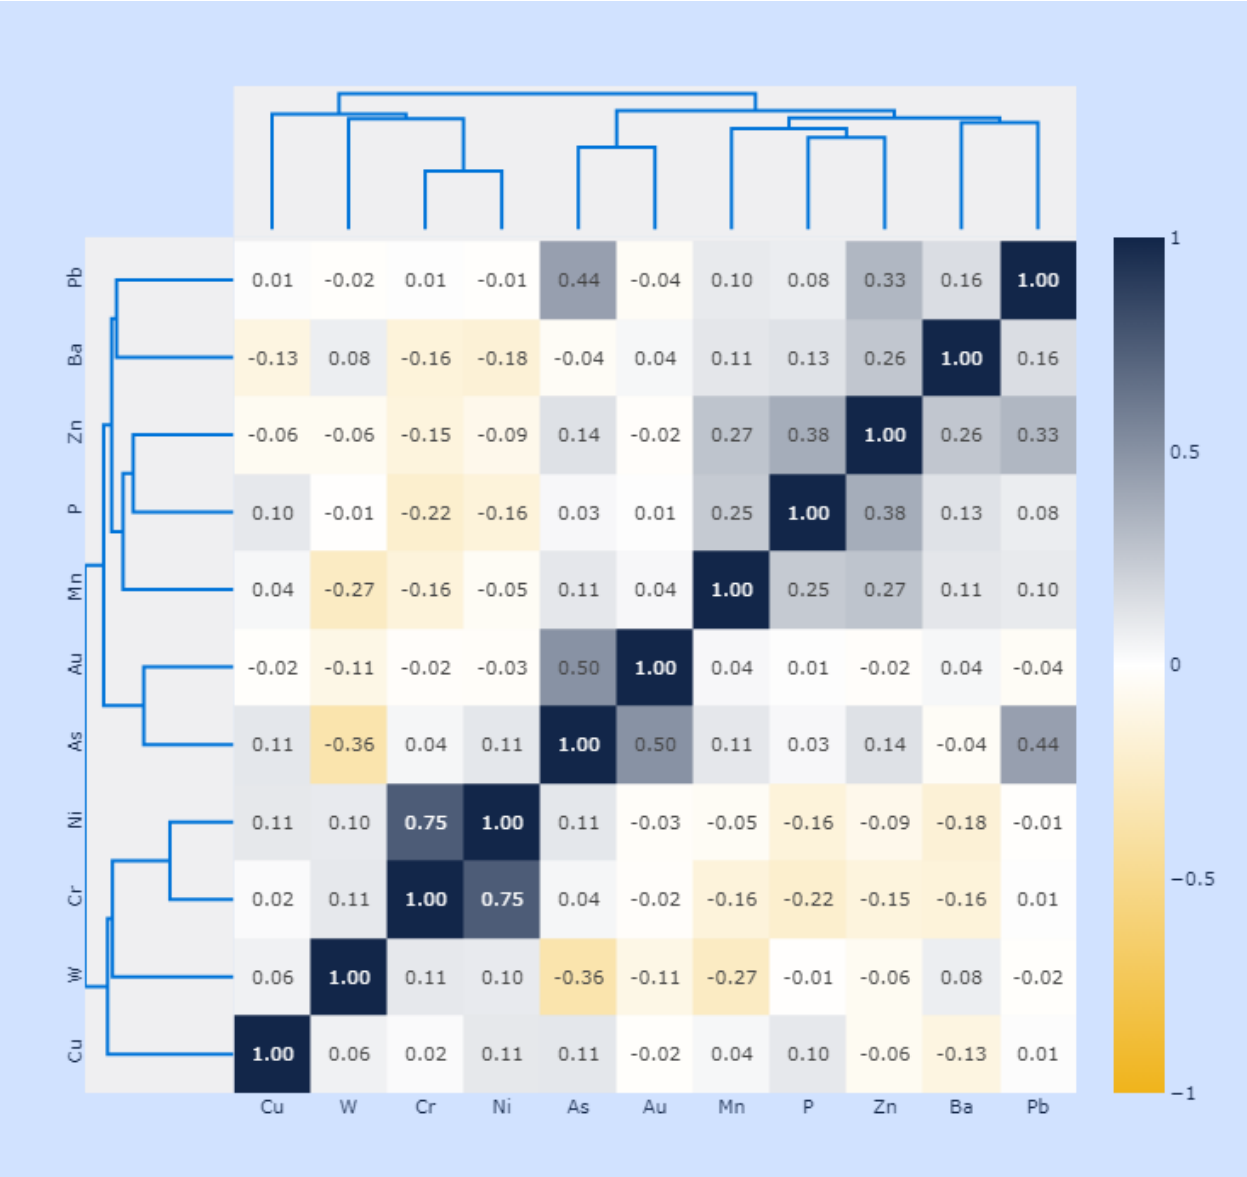
Histogram analysis identified nine (9) elements with a positive skewed distribution similar to arsenic. Figure 16 display a scatterplot matrix of these elements. Note that only one sample reported a gold value.

Figure 17 displays a dendogram of the relationships between these elements of interest. The dendogram reports the arsenic-gold correlation coefficient at 0.50. This is validation of the strong arsenic-gold relationship but is based on only one gold value.

Other elemental relationships identified by the dendogram include: a nickel-chromium correlation coefficient of 0.75; an arsenic-lead correlation coefficient of 0.44; and a moderate correlation of zinc to manganese, phosphorus, barium, and lead.

Figure 16 Scatterplot Matrix of Pathfinder Elements (pXRF)

Figure 17 Dendogram of Pathfinder Elements (pXRF)



Given the strong nickel-chromium correlation identified in Figure 17 and the possibility of the group being related to ultramafic volcanic identified by geological mapping, a second set of scatterplot matrix and dendrogram were created using typical lithology-controlled elements. A suite of eight (8) elements were chosen, including: aluminum, silica, potassium, rubidium, zirconium, chromium, nickel, and magnesium.

The scatterplot matrix in Figure 18 shows that the chosen elements have a normal 'bell curve' or a weak positive skew in their histogram distribution. The scatterplot shows that the correlation between elements vary from strongly positive correlation (ex. aluminum-silica) to strongly negative correlation (ex. chromium-potassium).

The dendogram in Figure 19 shows that these elements form three groupings; (1) chromium-nickel-magnesium, (2) aluminum-silica, and (3) zirconium-potassium-rubidium.

Figure 18 Scatterplot Matrix of Lithology Elements

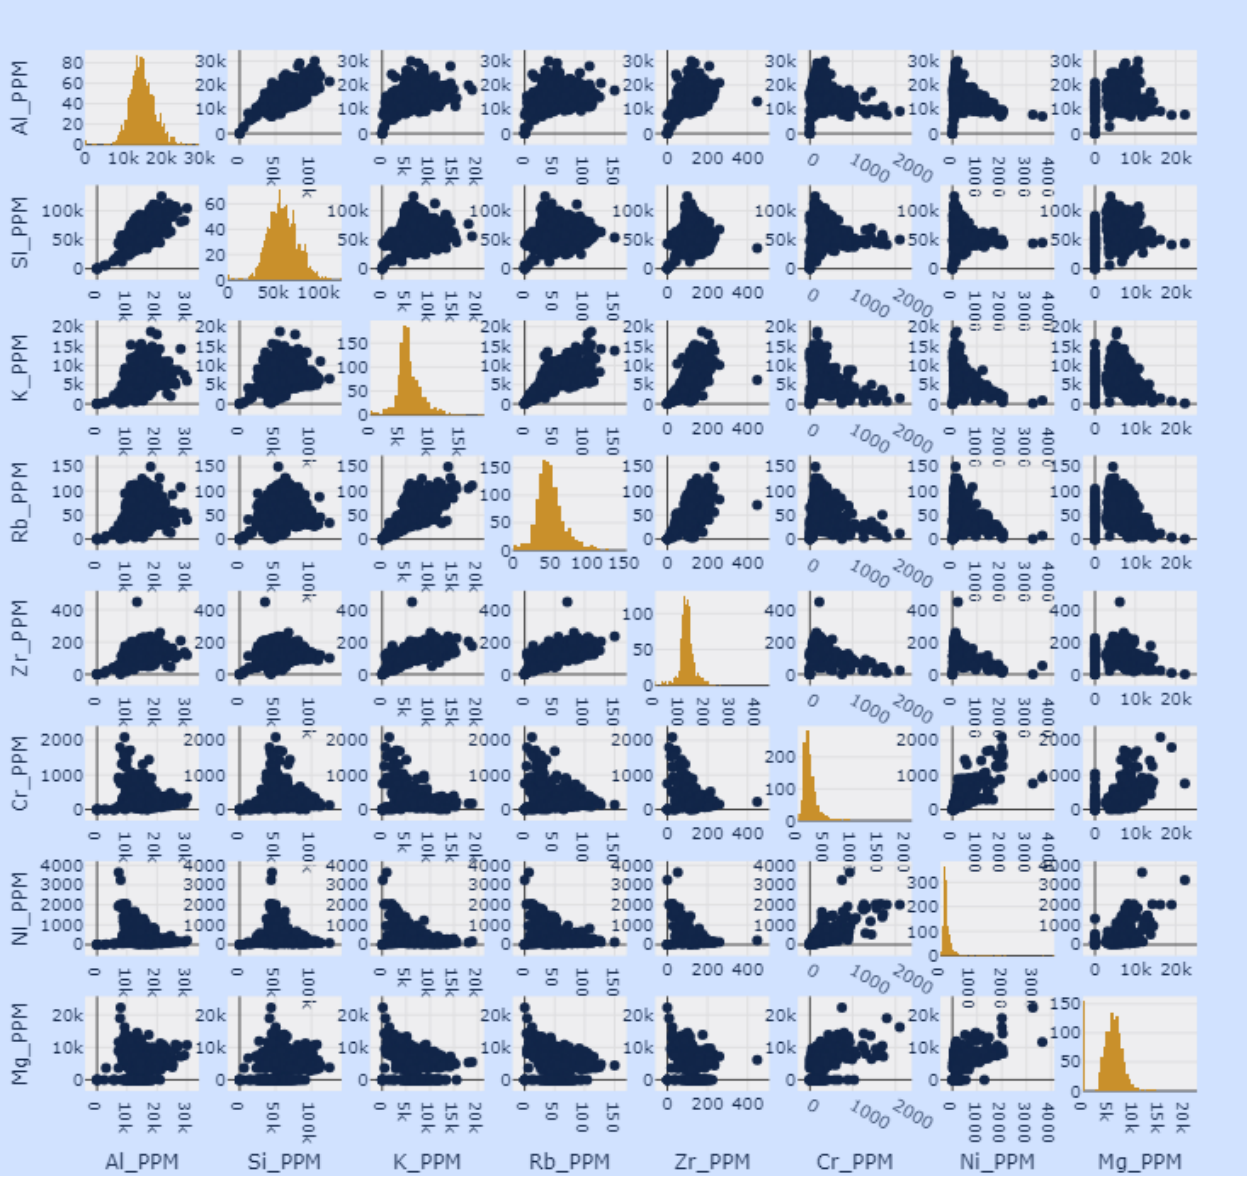


Figure 19 Dendogram of Lithology Elements

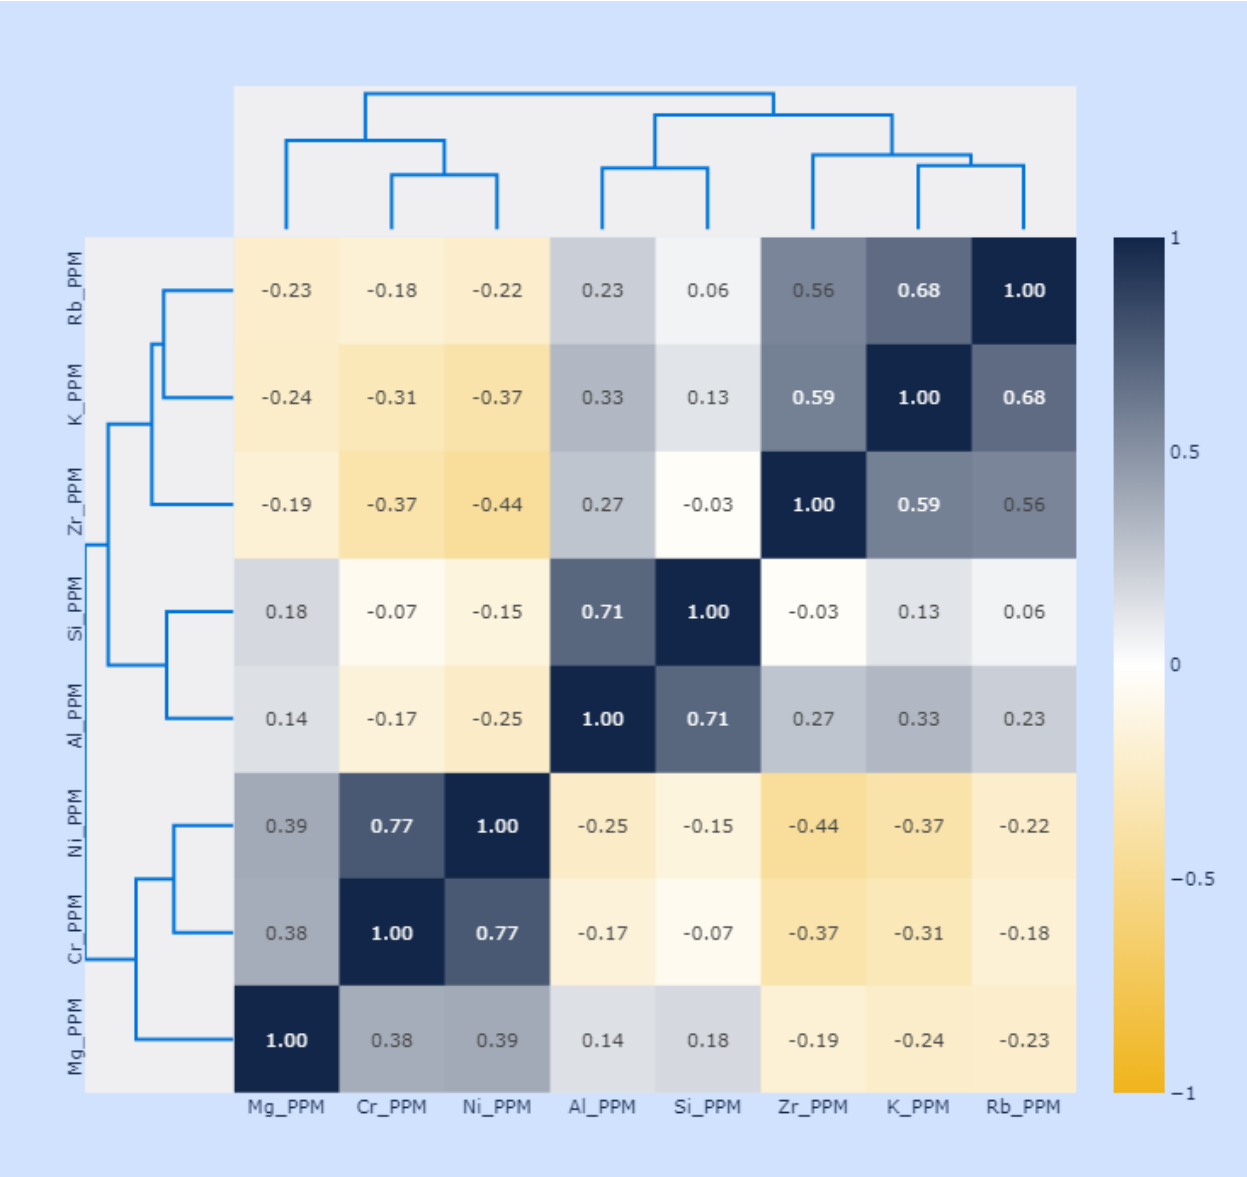
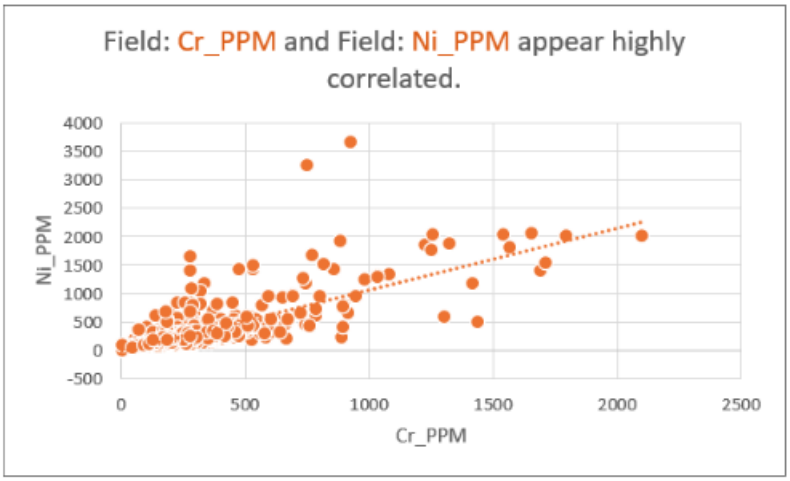
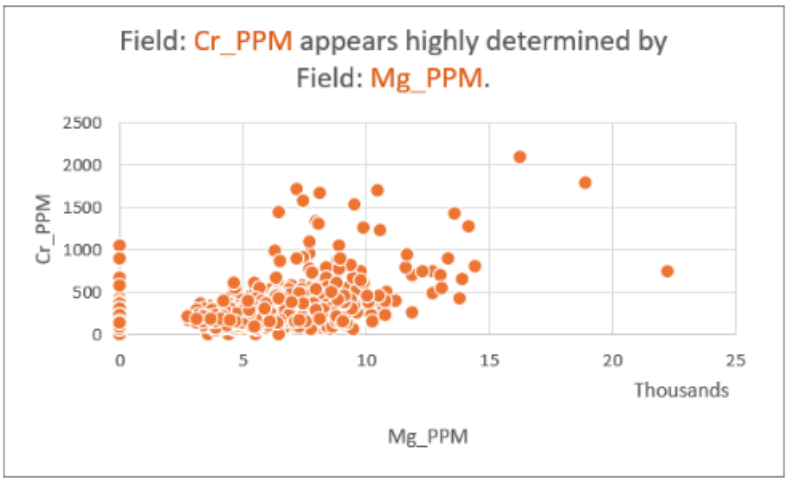
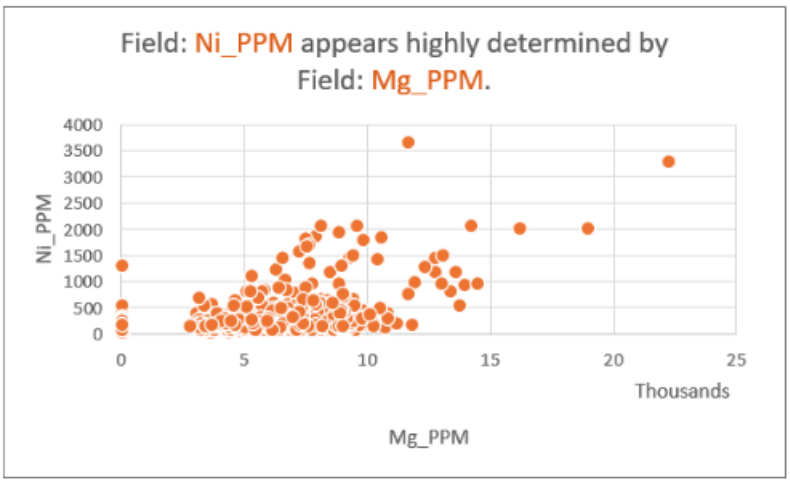


The chromium-nickel-magnesium grouping is most likely related to an ultramafic lithology being identified as a source of the talus-fine. Figure 20 shows the strong correlation between the three elements on scatterplots. Note the that the pXRF does not report magnesium less than 2.5 ppm.

Figure 20 Chromium-Nickel-Magnesium Scatterplots (Ultramafic)

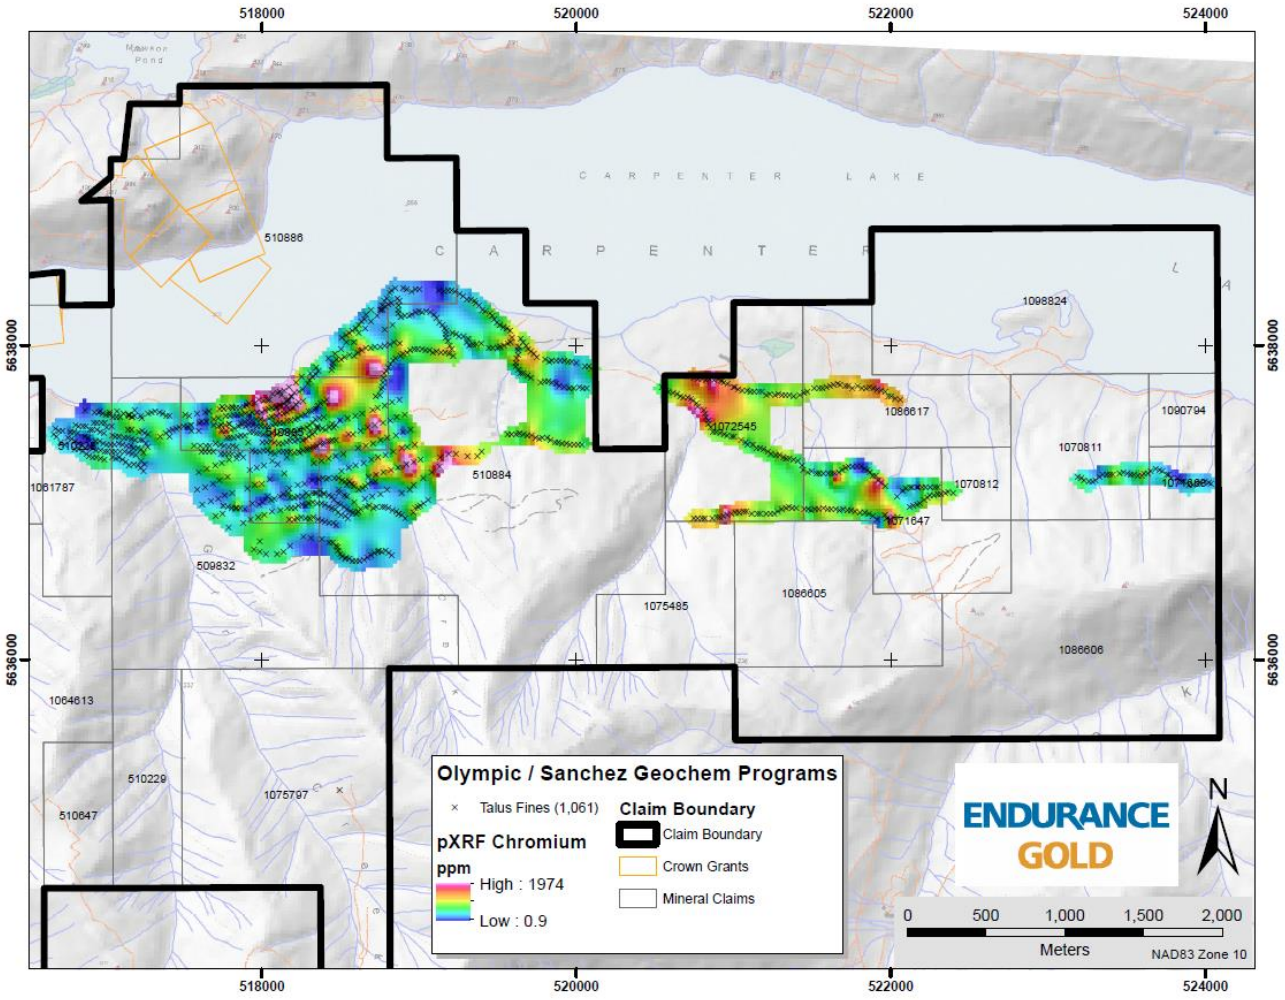






Gridded maps were produced for all three elements and Figure 21 shows the anomalous chromium as an example. The elevated chromium talus-fines samples most likely represent nearby ultramafic volcanics.

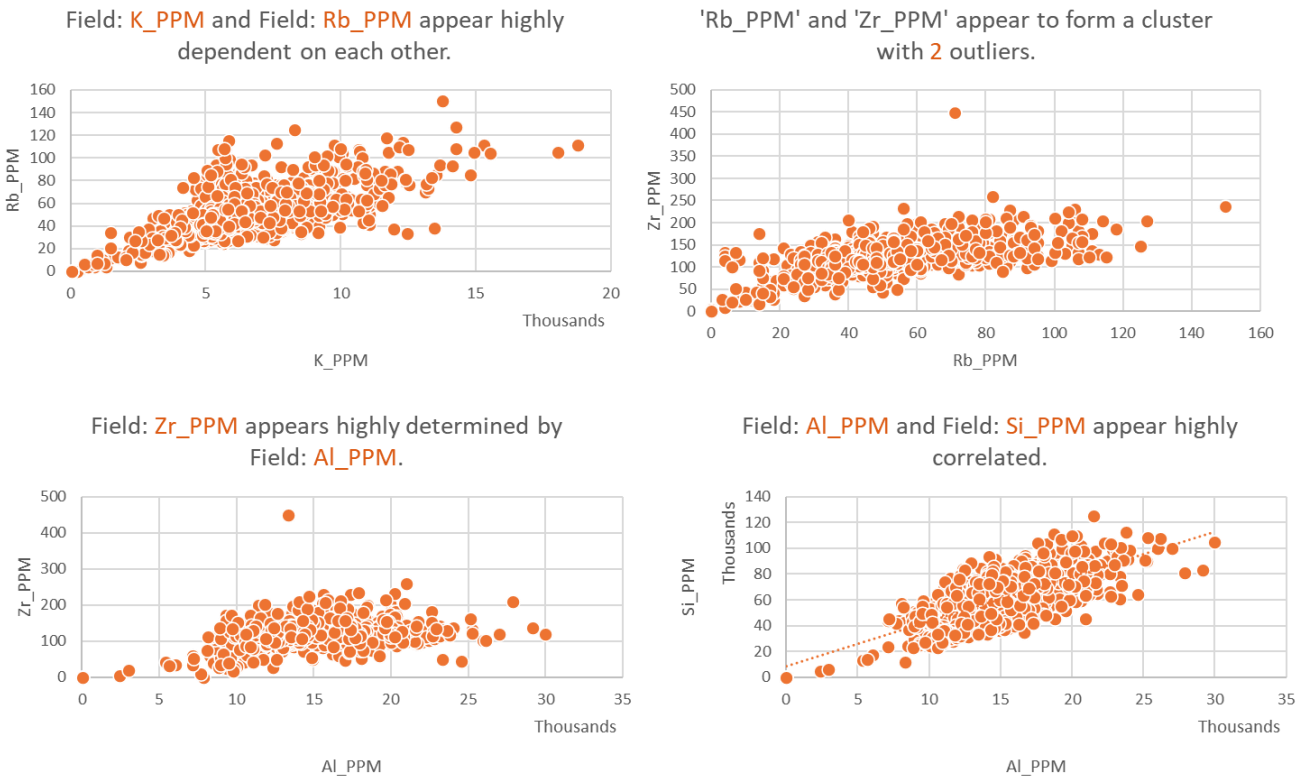
Figure 21 2022/2023 Talus-Fines (Chromium)



The aluminum-silica and zirconium-potassium-rubidium groupings were also investigated with scatterplots as shown in Figure 22. Aluminum appears to have a positive correlation with the other four (4) elements, while zirconium has a positive correlation with three (3) of the other elements. Silica only has a positive correlation with aluminum and does not correlate with the other three (3) elements.

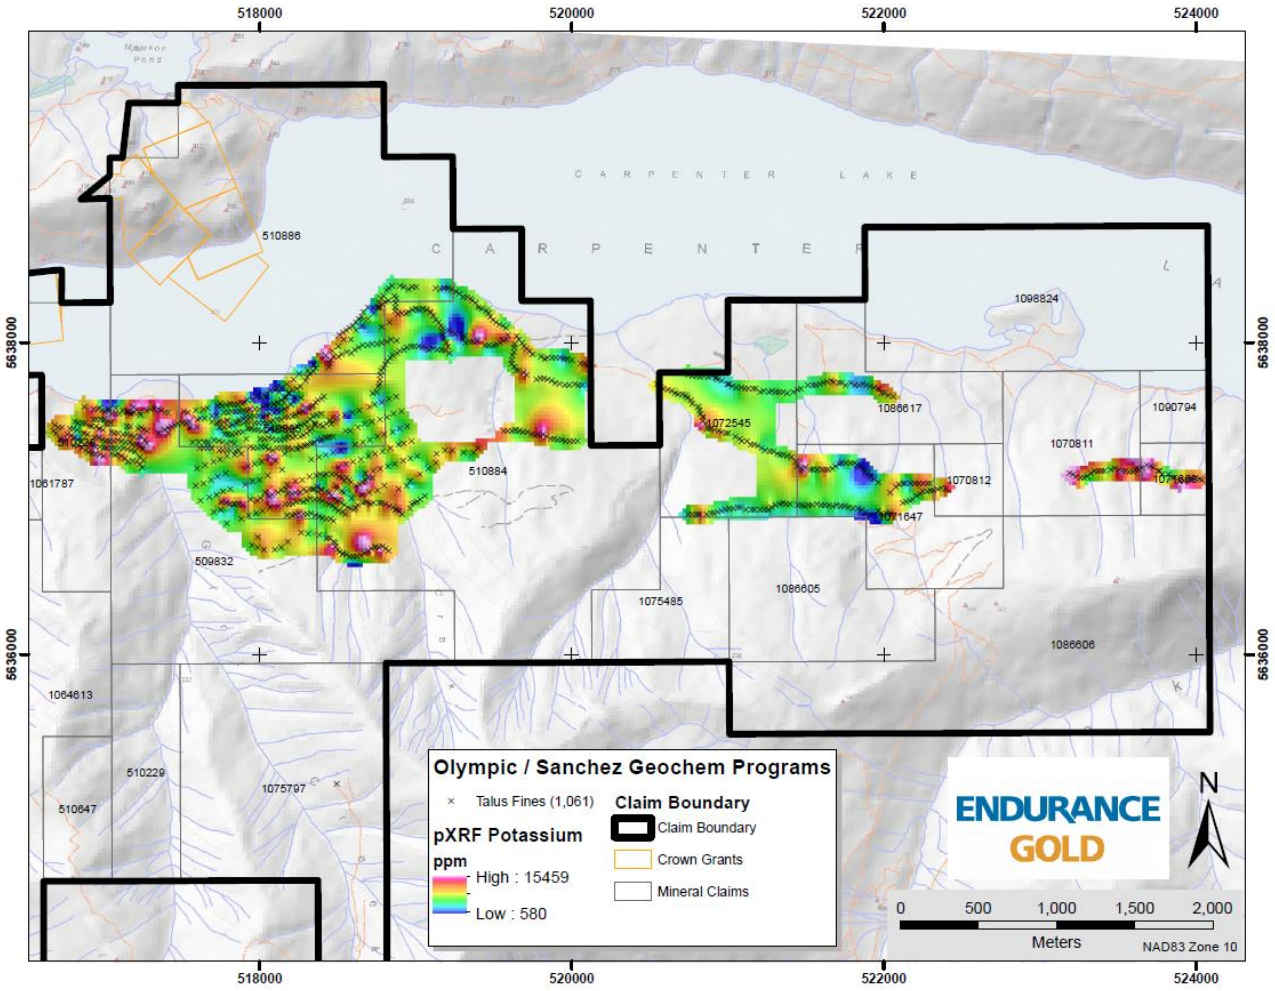
The relationship of these five (5) elements to a source lithology is not as clear as the chromium-nickel-magnesium relationship. Anomalous values from any of these five (5) elements could represent felsic to intermediate volcanic or intrusive lithologies, or sedimentary cherts or argillites that have been mapped in the area.

Figure 22 Aluminum-Silica-Zirconium-Potassium-Rubidium Scatterplots (Felsic / Intermediate Rocks)



Gridded maps were produced for all five elements and Figure 23 shows the anomalous potassium as an example.

Figure 23 2022/2023 Talus-Fines (Potassium)



6.4 Ionic Leach Soil Sampling (Enigma Grid) – Field Collection Procedures

A 275-sample soil sampling grid was conducted during the 2023 field season over the Enigma Showing on the Olympic claims. The program was designed to follow up on encouraging grab sample results from the Enigma Showing collected during the 2022 season. Initial soil sample traverses collected in 2022 across the Enigma Showing had little response from the pXRF analysis. Further investigation determined that the area was covered by glacial-fluvial till most likely locally derived from the Howe Creek drainage.

To compensate for the glacial-fluvial till sampling, a partial weak leach extraction technique was utilized for the 2023 Enigma grid. The ALS Ionic Leach analytical method (ME-MS23) and field sampling techniques were utilized. A technical note 'white paper' from ALS Global and a list of analyte detection limits can be found in Appendix E.

Soil samples were collected in a grid pattern of 50 m line spacing and 25 m sample intervals. The sample lines were oriented 070 degrees. The samplers dug through the Bridge River Ash layer to sample the glacial-fluvial till below. Similar to other parts of the property, the ash formation is often dry, unconsolidated, and over one metre thick, making it difficult to penetrate with a soil auger. Samplers have found the best method is to dig through the ash using a common spade shovel.

After the glacial-fluvial till is exposed, samples were collected using a plastic handheld gardening trowel. Samplers would collect the sample approximately 10 to 25 cm below the ash. There was typically no organic horizon with ash sitting directly upon till. The till samples were not screened in the field, but large rock pebbles and organic roots were removed by hand prior to placing the samples in a plastic 'Ziplock' bag. The plastic sample bag was double bagged with the paper sample tag placed in the outer bag. Plastic sampling tools and double bagging were utilized to minimize contamination due to the low detection limits of the Ionic Leach analytical method.

The samplers recorded observations in a paper notebook or ESRI Survey123 app, recorded GPS coordinates with a Garmin handheld, wrote the sample tag number on the outer Ziplock bag, took a photo, and finally marked the sample location with flagging tape.

At the end of the sampling day, soil sample bags were organized in sequence in the Company's rental garage and bagged in large rice bags for shipping. No air drying occurred and the Ziplock bags remained sealed in order to minimize contamination.

All 275 samples were analysed by ALS Geochemistry in North Vancouver, an ISO/IEC 17025:2017 accredited laboratory. Samples were placed in rice bags and labelled with the shipping address, sample sequence and a company contact. Rice bags were sealed with a zip tie and a security tag. Samples were delivered to ALS by a Company geologist.

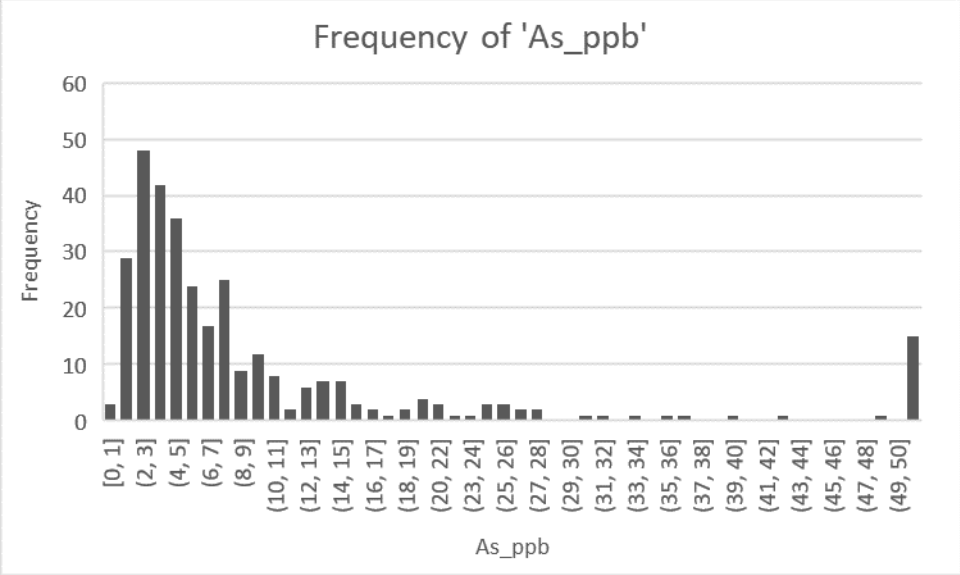
6.5 Ionic Leach Soil Sampling (Enigma Grid) – Analysis and Results

Sample descriptions can be found in Appendix D, and the ALS assay certificate is included in Appendix F.

The ALS Ionic Leach geochemical method reports quantitative results for a suite of 61 elements allowing for analysis of key precious metal pathfinder elements such as arsenic, and/or identifying metal zonation related to geologic signatures and alteration zones. The method also measures pH acidity of the sample.

Arsenic is a known pathfinder for gold mineralization in the Bridge River Camp. The Ionic Leach reported a quantitative amount of arsenic with a maximum value of 764 ppb, a minimum of 0.15 ppb, with a median of 5.6 ppb and mean of 14.9 ppb. The arsenic distribution produced a smooth, positively skewed histogram showing arsenic enrichment and outliers greater than 50 ppb (see Figure 24).

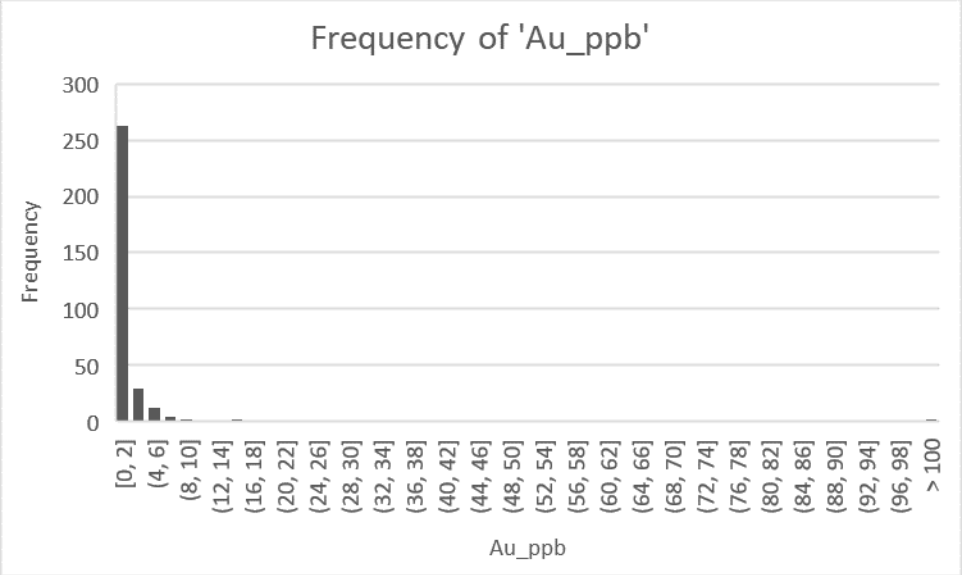
Figure 24 Arsenic Histogram (Ionic Leach analysis)



While direct analysis of gold using the Ionic Leach method can be achieved, it does not produce a smooth distribution as seen on the histogram (see Figure 25). The Ionic Leach reports low gold values with 'spiky' high outliers. The gold maximum value is 752 ppb, a minimum of 0.9 ppb, with a median of 0.6 ppb and mean of 4.5 ppb.

Given the strong arsenic-gold correlation and the better reported distribution, it can be inferred that arsenic can be used as a proxy for gold exploration.

Figure 25 Gold Histogram (Ionic Leach Analysis)



To test for other potential gold pathfinder elements, a correlation matrix was created in Microsoft Excel (see Appendix D), and a series of histograms and scatterplots were created using the ALS Goldspot online system (see Figure 26). A dendogram was also created to visualize relationships of the different elements (see Figure 27).

It was determined that arsenic had the highest correlation to gold, antimony, zinc and cadmium with correlation coefficients of 0.34, 0.79, 0.52, and 0.30, respectively. Scatterplots of these five elements are shown in Figure 28.

The dendogram indicates a strong relationship between gold, arsenic and antimony which concurs with the known gold-arsenopyrite-stibnite mineralization association at the Reliance Gold Project. Zinc and cadmium appear to have a strong relationship with silver and copper, indicating a different mineral suite possibly not related to the gold mineral system.

The dendogram also identifies a tungsten-tantalum-titanium-vanadium association that is most likely related to a geological signature or alteration zonation. Tungsten is known to be anomalous in the Eagle and Imperial deposits of the Royal Shear.

Figure 26 Scatterplot Matrix and Histograms of Ionic Leach Pathfinder Elements

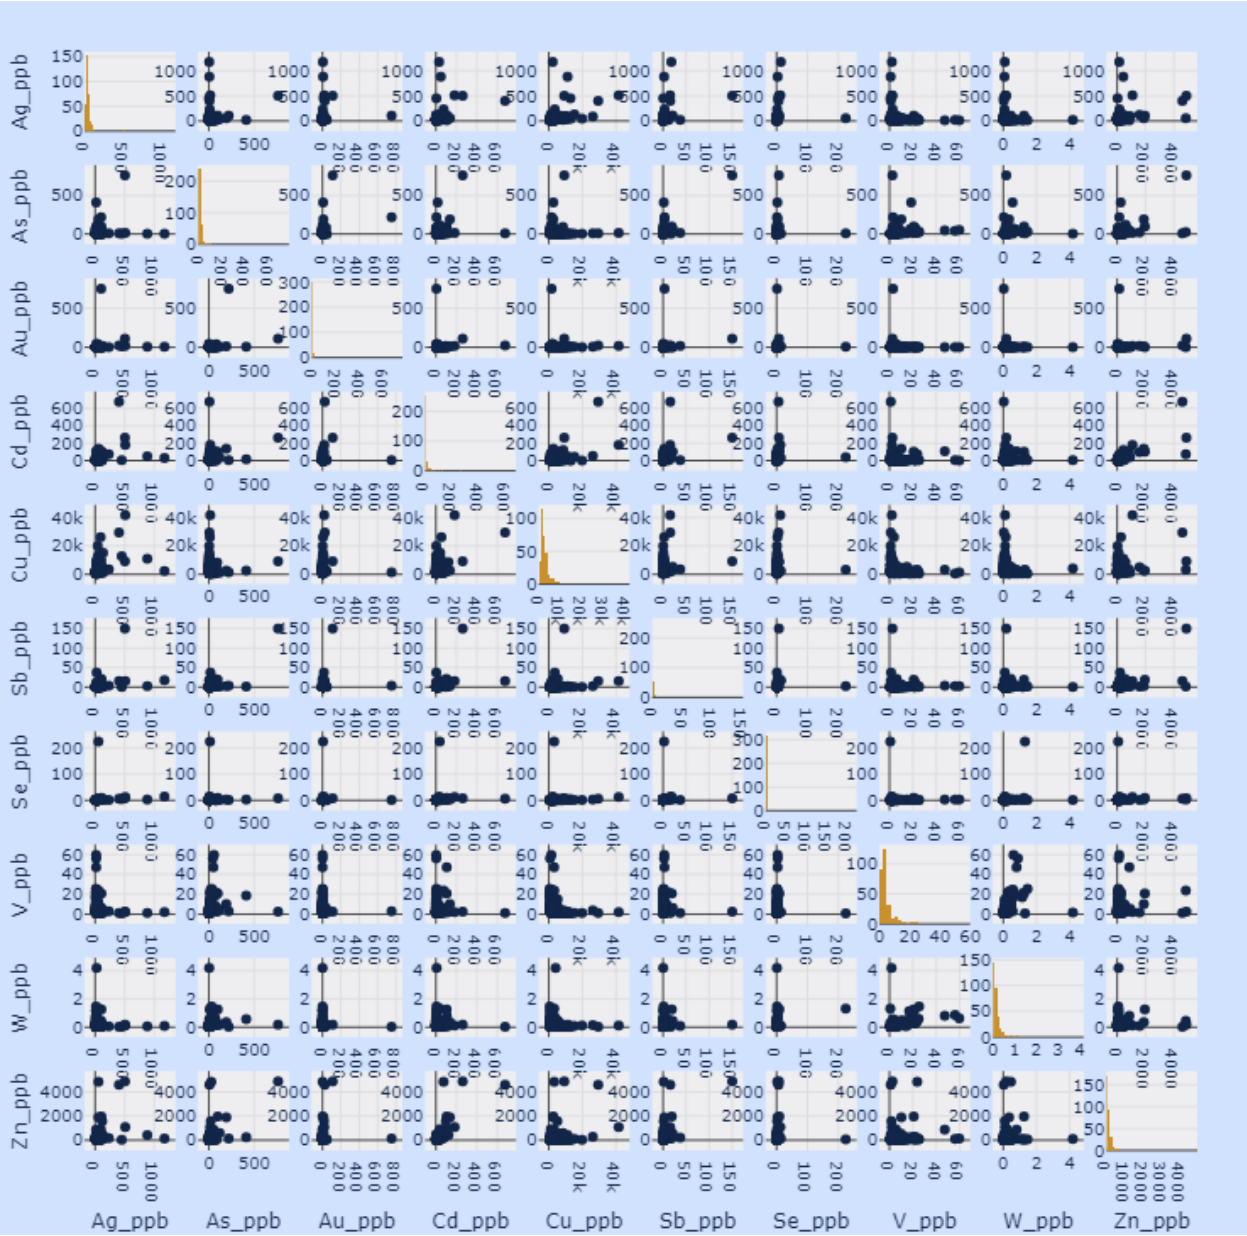


Figure 27 Dendogram of Ionic Leach Pathfinder Elements

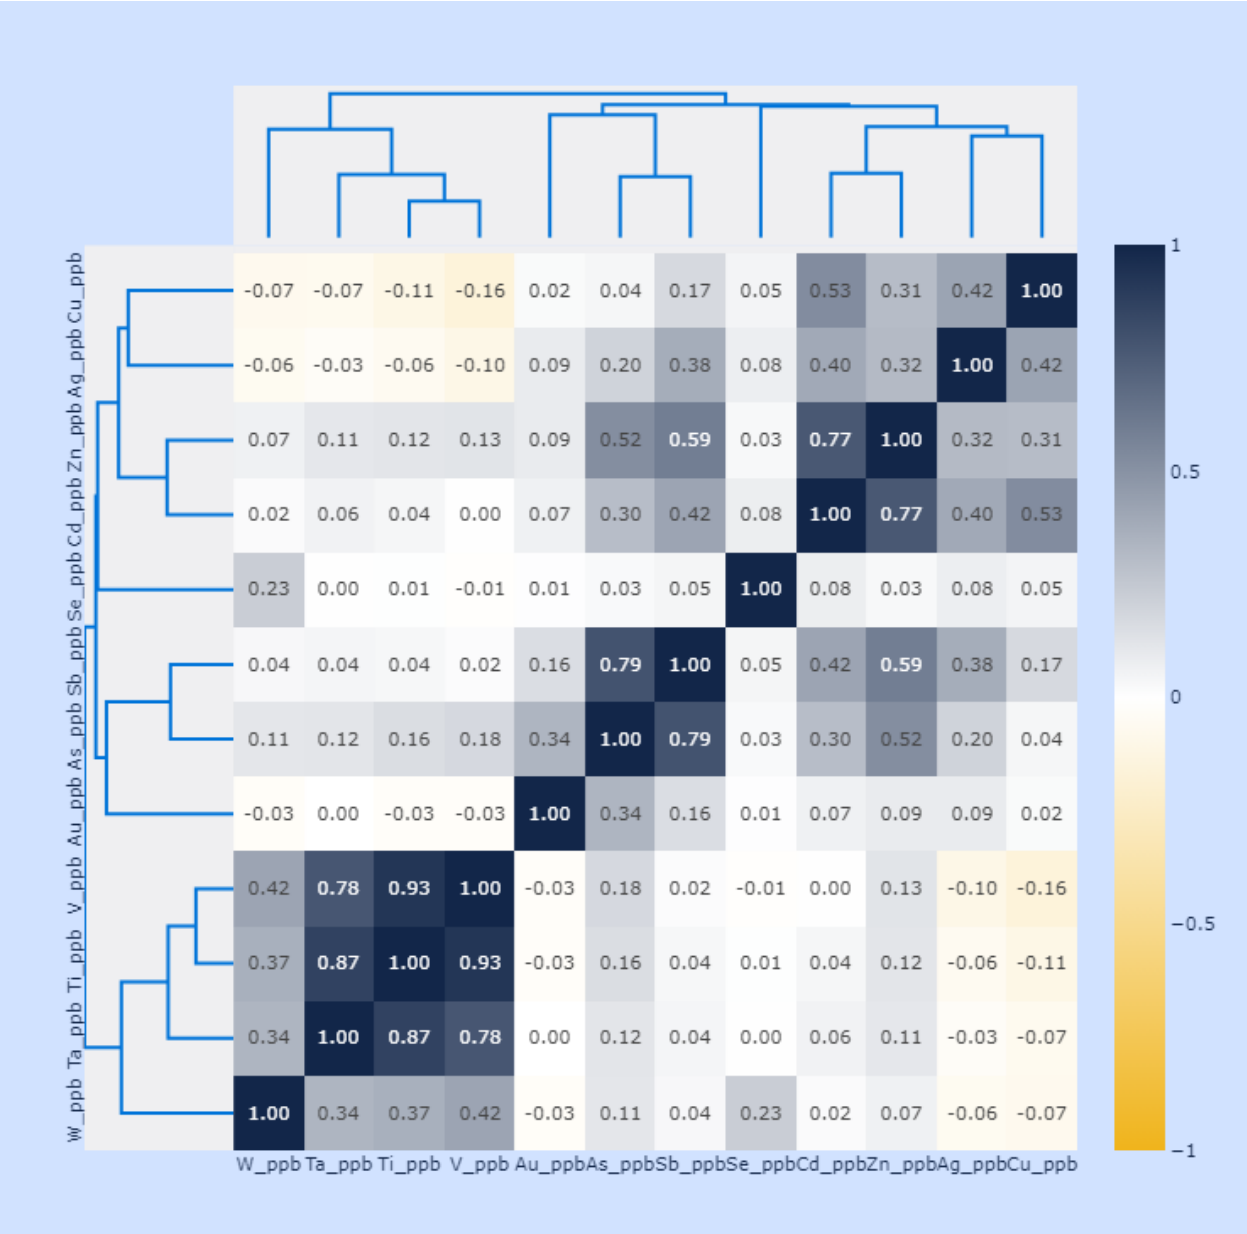

Figure 28 Scatterplots of As vs. Au, Zn, Sb, Cd (Ionic Leach)

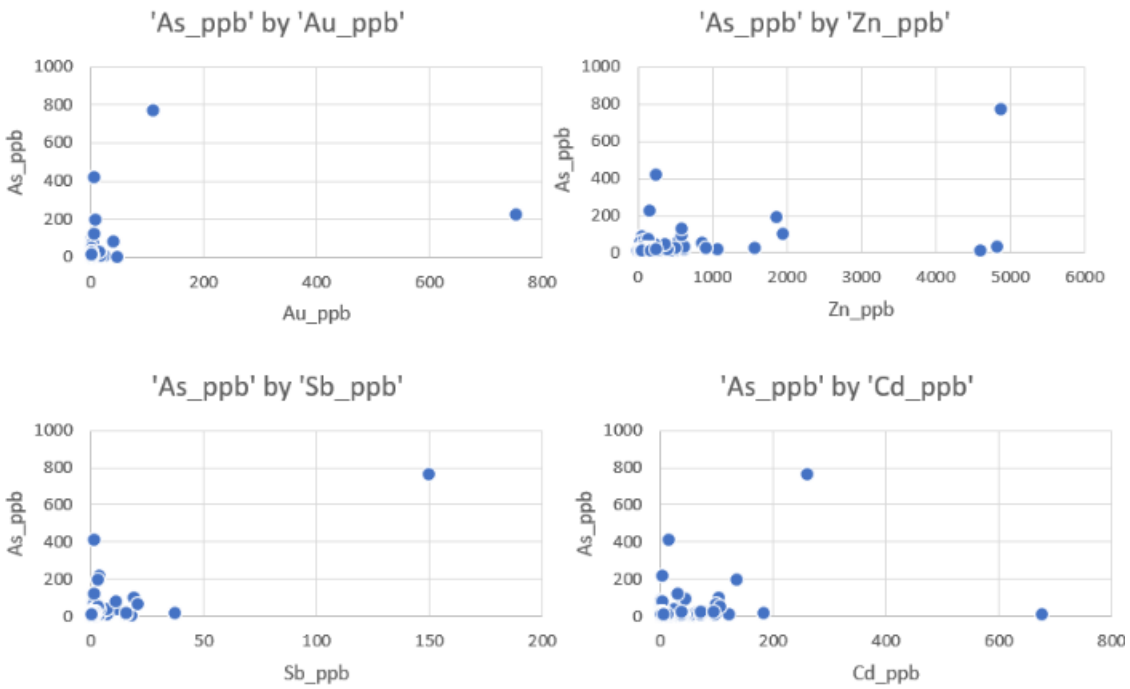
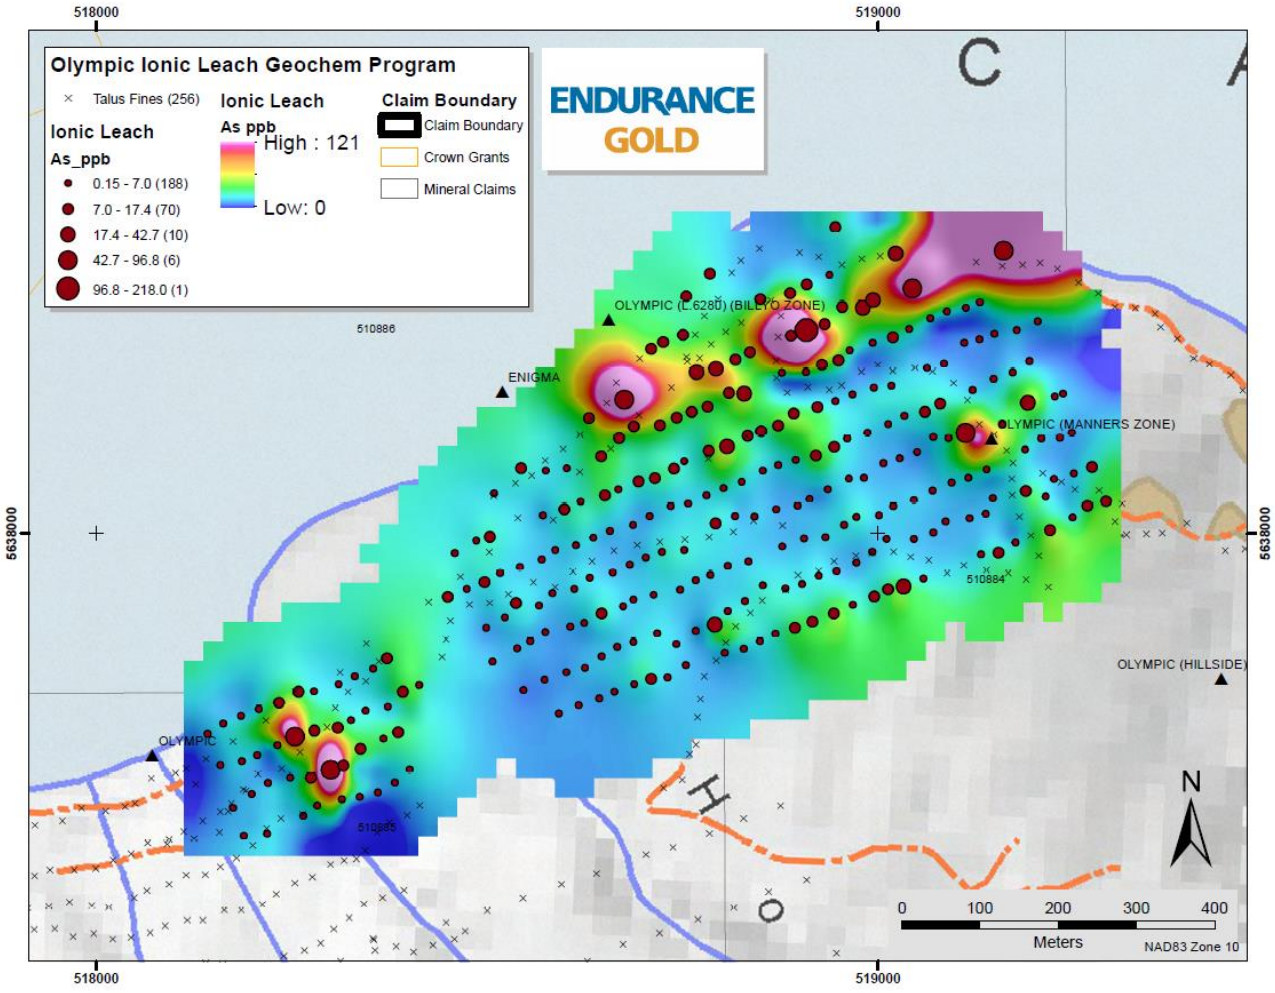


The Ionic Leach soil sampling results for the Enigma Grid are displayed in the following maps. The arsenic map (Figure 29) indicates an arsenic enrichment in the northeast quadrant of the grid. The enriched zone has a northeast-southwest trend that is parallel to the Carpenter Lake shoreline and appears to be related to the Enigma showing identified in shoreline outcrop. There is a second smaller zone of arsenic enrichment in the southwest quadrant of the grid with a northwest-southeast trend and subparallel to the Howe Creek drainage.

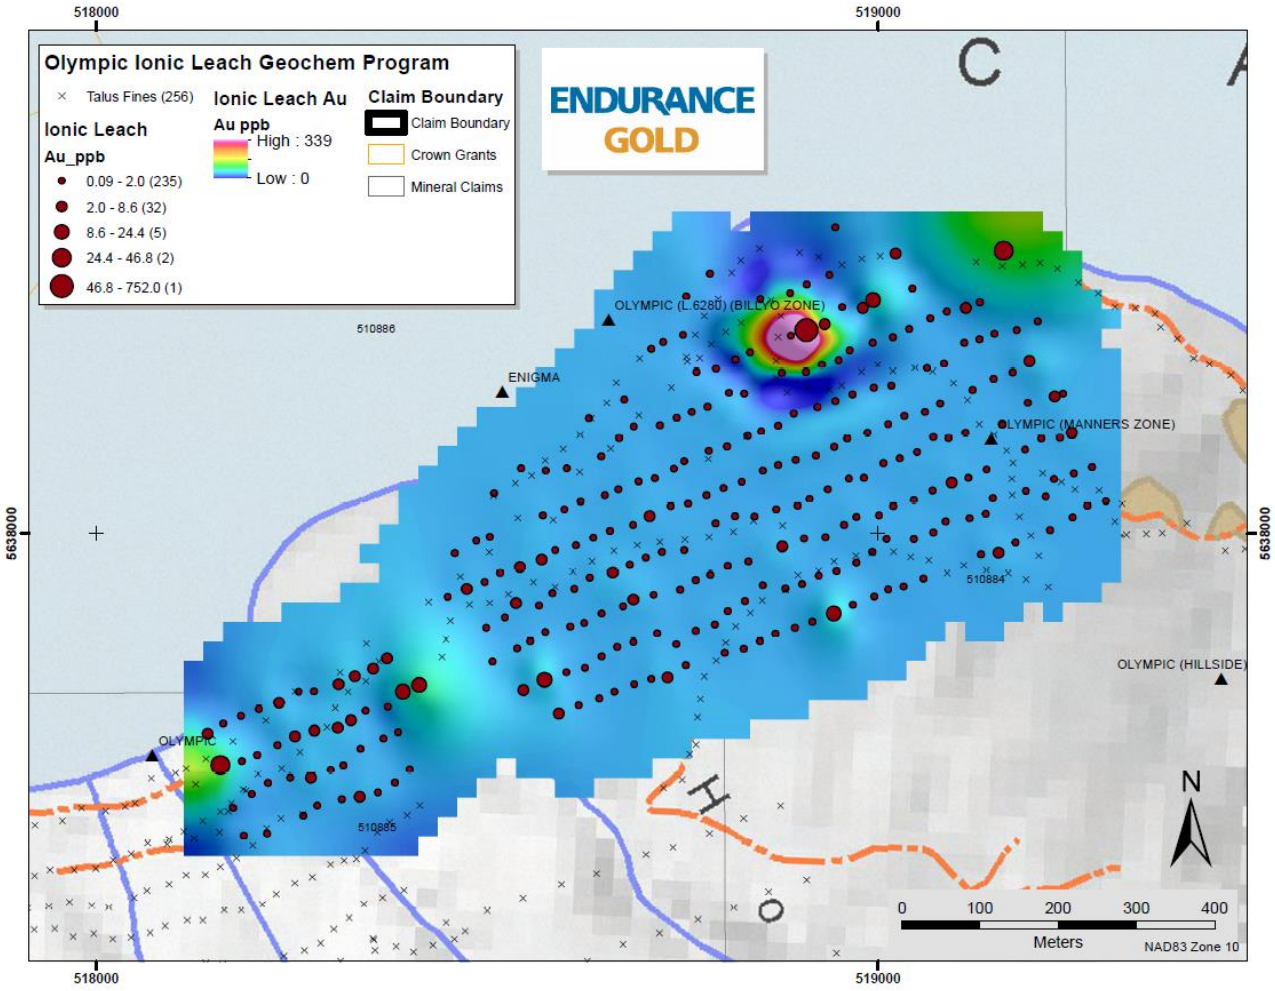
A series of detailed geochemical maps plotting arsenic values for each individual sample can be found in Appendix I.

Figure 29 Enigma Grid - Ionic Leach Arsenic



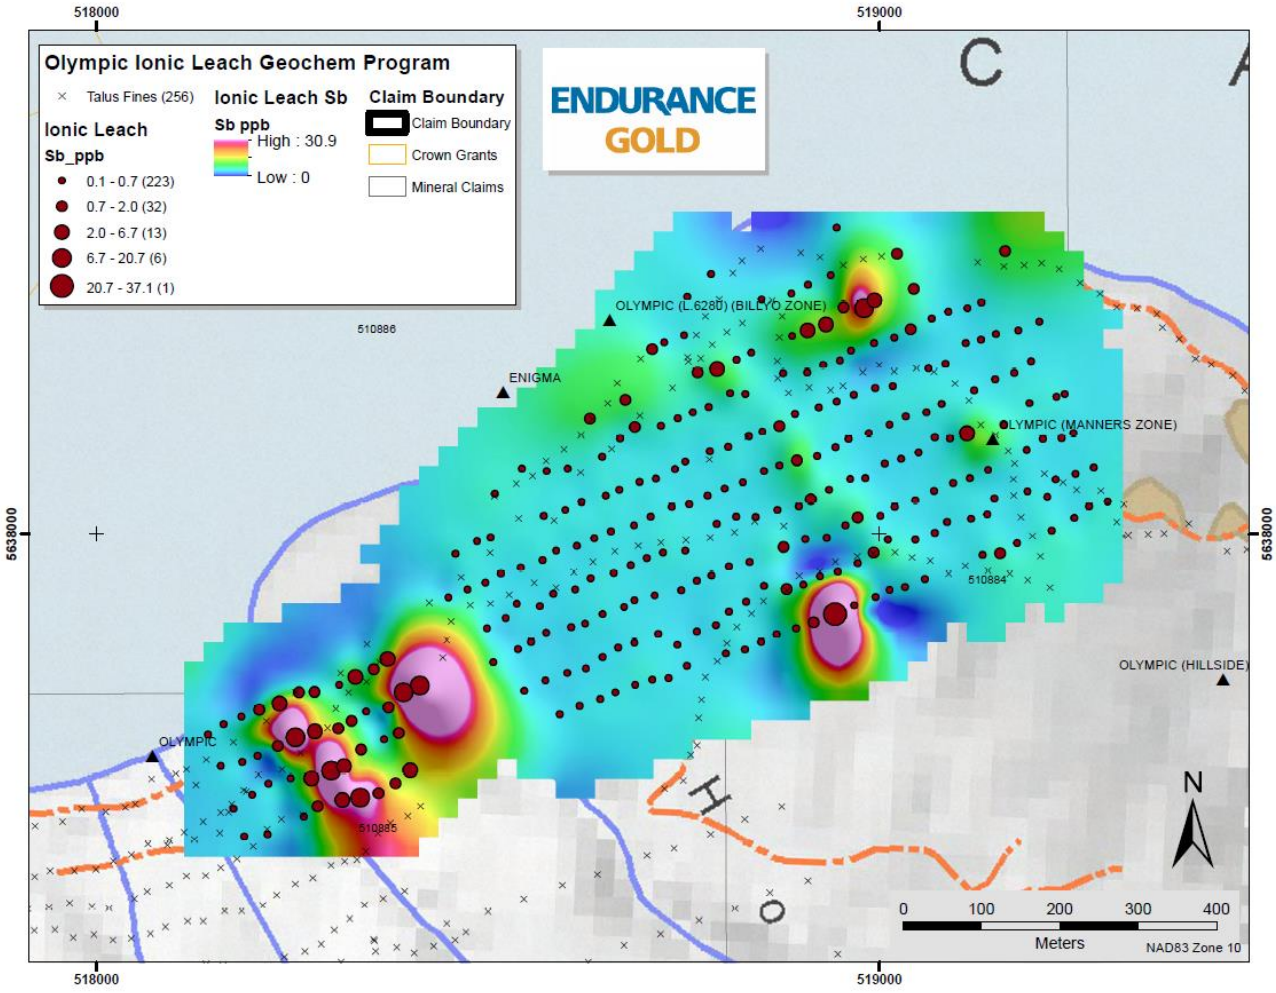
The Figure 30 map displays the gold results. The Ionic Leach method did not return a smooth distribution of gold values and only eight (8) samples returned greater than 8.6 ppb Au. The higher-grade outliers did correspond to the arsenic anomaly in the northeast quadrant of the grid.

Figure 30 Enigma Grid - Ionic Leach Gold



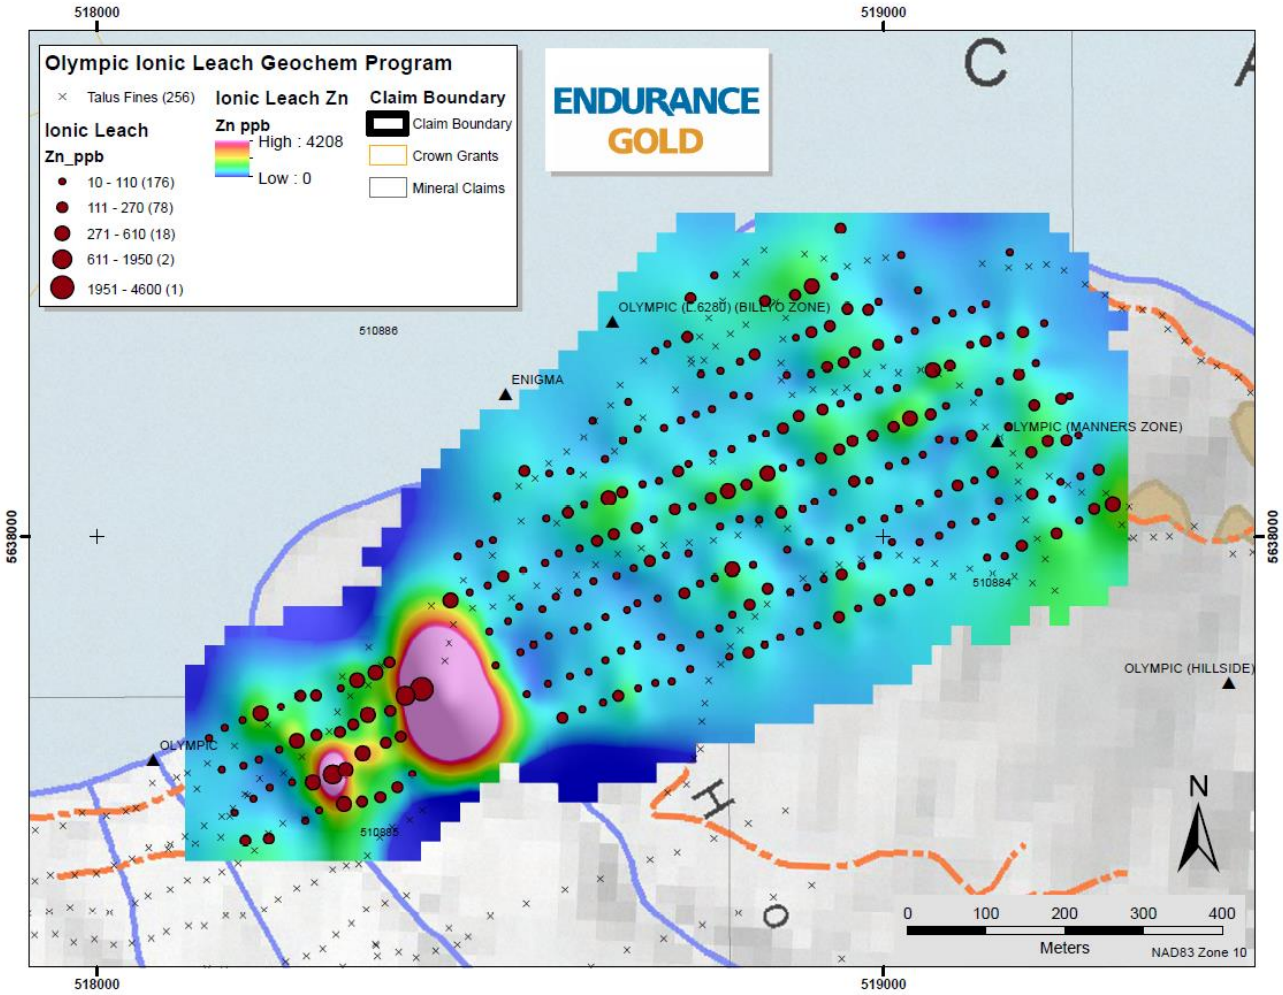
The Figure 31 map shows the antimony distribution similar to arsenic. There is a linear anomaly in the northeast quadrant (albeit weaker) near the Enigma Showing, and a stronger linear anomaly in the southwest quadrant near the Howe Creek drainage.

Figure 31 Enigma Grid - Ionic Leach Antimony



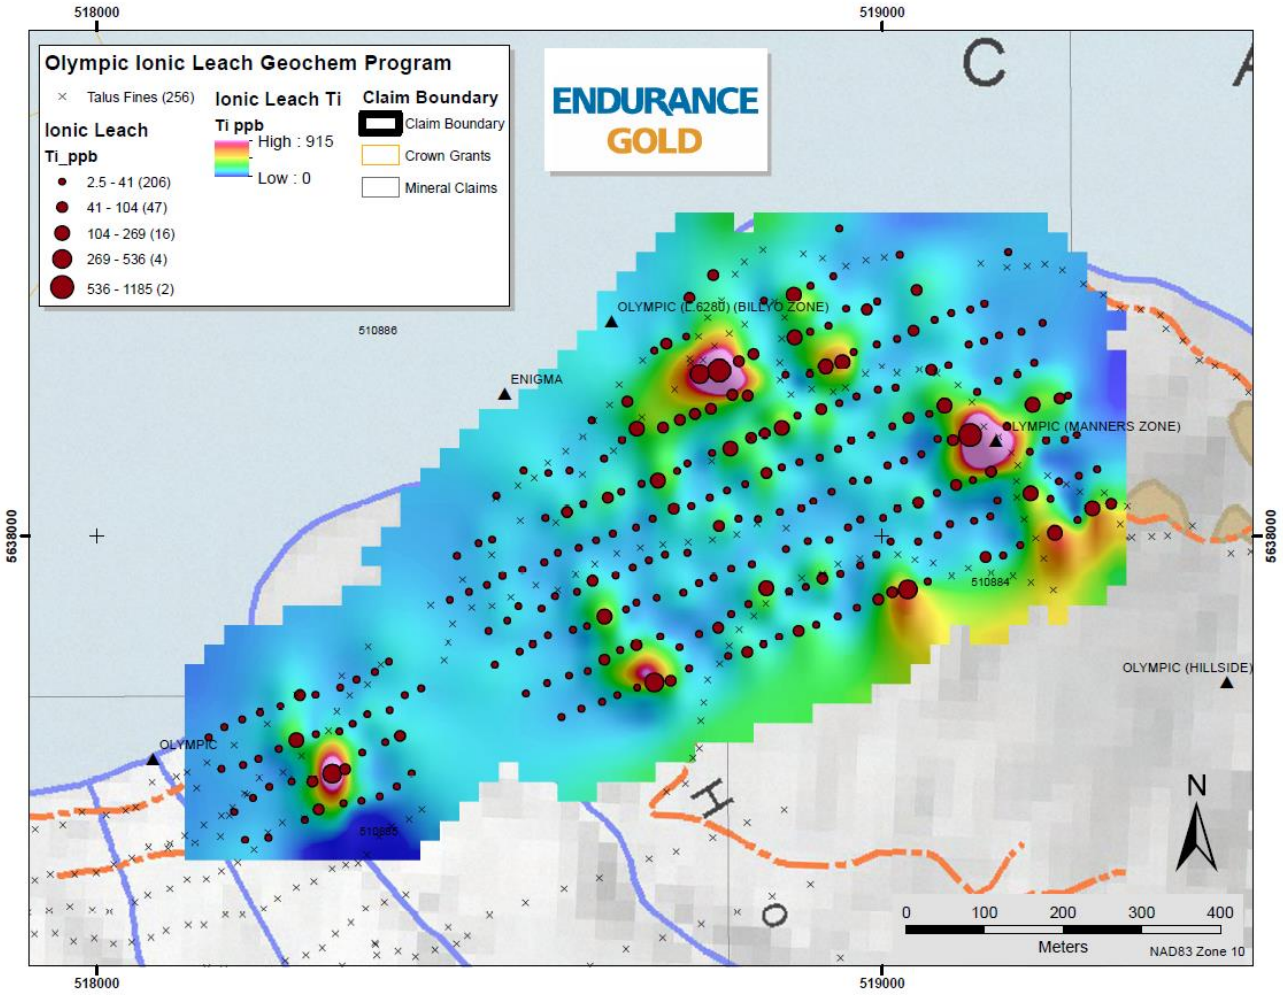
Zinc and cadmium had similar distributions when plotted on the Enigma grid map. Figure 32 shows the zinc anomaly as an example. The highest zinc and cadmium values were returned from the southwest quadrant near Howe Creek. The linear zinc anomaly appears to be adjacent and parallel to the stibnite anomaly. There were no elevated zinc or cadmium samples from the northeast quadrant (Enigma Showing).

Figure 32 Enigma Grid - Ionic Leach Zinc



Tungsten, tantalum, titanium and vanadium appear to correlate with each other and had similar distributions when plotted on the Enigma grid map. Figure 33 shows titanium distribution as an example as it has the highest-grade variability of the four (4) elements. These elements are most likely related to lithological stratigraphy or alteration zonation.

Figure 33 Enigma Grid - Ionic Leach Titanium



It is known that soil acidity can have a strong control over the mobility of ions. The correlation coefficient matrix (Appendix D) shows that soil pH has a negative correlation with 25 of the elements reported by the Ionic Leach method. There is a strong correlation between soil acidity and the rare earth elements as shown in Figure 34 where more acidic soil (pH 5-7) is enriched in rare earths, while basic soils (pH 7-9) are depleted of these elements. None of the gold pathfinder elements appear to be affected by soil pH.

Figure 35 shows soil pH variability across the Enigma grid.

Figure 34 Soil Acidity and Rare Earth Elements

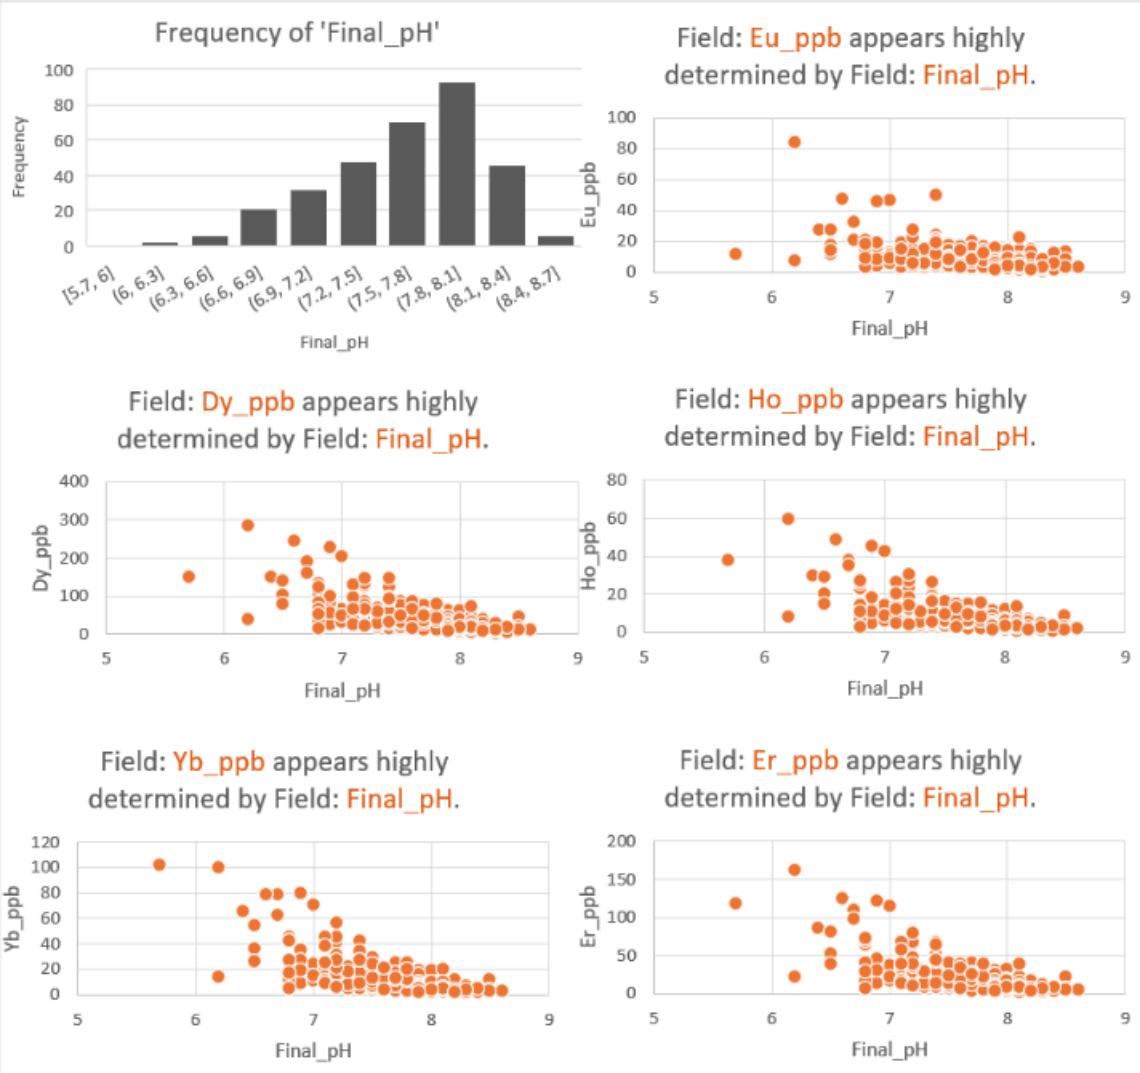


Figure 35 Enigma Grid - Soil Acidity (pH)

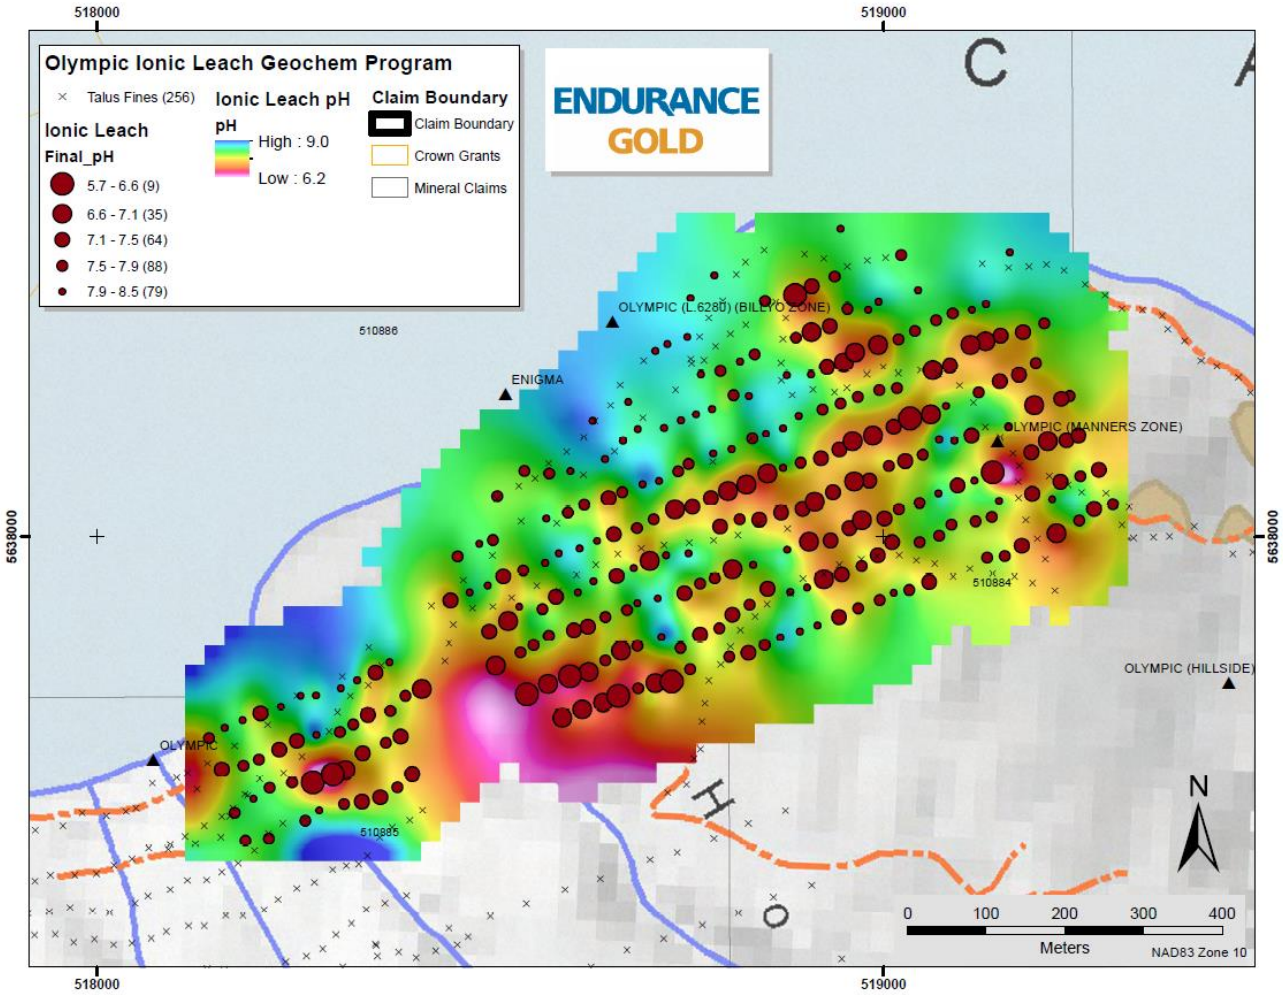

6.6 Rock Grab Samples

In 2023, Endurance Gold collected 19 rock grab samples from areas within the Olympic and Enigma soil sampling grids. All of the 2023 samples were collected and described by geologists. The Company previously collected seven (7) rock samples from the Enigma Showing during the 2022 field season which were collected and described by prospectors. All rock sample descriptions can be found in Appendix G.

All 26 rock samples collected in the 2022/2023 field seasons were analyzed by ALS Geochemistry in North Vancouver, an ISO/IEC 17025:2017 accredited laboratory. Samples were placed in rice bags and labelled with the shipping address, sample sequence and a company contact. Rice bags were sealed with a zip tie and a security tag. Samples were delivered to ALS by a Company geologist.

Rock samples were crushed to 70% <2 mm then up to 250 gram pulverized to <75 microns. Samples were then submitted for four-acid digestion and analyzed for 48 element ICP-MS (ME-MS61) and gold 30g FA ICP-AES finish (AU-ICP21). Over limit samples returning greater than 10 ppm gold were re-analyzed by Au-GRA21 methodology and over limit zinc returning greater than 10,000 ppm Zn were re-analyzed by Zn-OG62 methodology. An assay certificate for the 2023 samples can be found in Appendix H.

For the combined 2022/2023 sampling programs, there were nine (9) rock samples that assayed greater than 1 ppm gold (see Table 4). Five (5) of the rocks were from the Enigma prospect, while four (4) were from the Kelvin prospect. Rock sample locations are shown on Figure 36 and in Appendix I.

Table 4 Significant Rock Samples

Sample ID	Type	Year	Prospect	Easting	Northing	Elevation	Au ppm	Ag ppm	As ppm	Sb ppm	Zn ppm
C964411	Rock Grab	2022	Enigma	518610	5638149	646	4.10	1.2	>10000	67800	22

Figure 37 displays grab sample C964411 from the Enigma Showing with coarse stibnite crystals in a quartz-ankerite vein. The sample assayed 4.1 ppm gold, 6.78% antimony and >10,000 ppm arsenic.

Figure 38 is a mineralized shear structure from the Kelvin Showing within the Olympic soil grid. The 20 cm wide gossanous vein is bounded by 1-2 cm rims of semi-massive arsenopyrite-pyrite. Selective sampling of the vein assayed 25.1 ppm gold and >10,000 ppm arsenic (Sample H614466). The wall rock of the vein assayed 5.55 ppm gold and >10,000 ppm arsenic (Sample H614465). The vein is oriented at 198^{o} dip direction / 78^{o} dip.

7 DISCUSSION AND CONCLUSIONS

In 2022, Endurance Gold conducted a geochemical orientation survey over the Olympic claims consisting of 432 talus-fines soil samples and 317 Douglas Fir tree clippings to test two shear zones 3 km east of the Royal Shear that hosts the Imperial and Eagle deposits. The combination of talus-fine samples and biogeochemical samples identified a geochemical anomaly with a strike length of 1.6 km. The anomaly was defined by elevated arsenic (+/- antimony), giving a similar geochemical signature to the initial sampling that discovered the Eagle Zone in 2020 (Endurance Gold News Release, January 3, 2023).

Prospecting and sampling in 2022 also identified high-grade gold-stibnite veins at the Enigma Showing approximately 900 m east of the Olympic soil anomaly. The Enigma veins were identified in a 75 m wide ankerite shear zone where grab samples returned assays up to 9.66 ppm gold and 11.9% antimony. The Enigma Shear is exposed in outcrop on the south shoreline of BC Hydro's Carpenter Reservoir and is a known BCGS MinFile occurrence (MINFILE# 092JNE152).

In 2023, Endurance Gold expanded on the 2022 program by conducted grid and contour soil sampling on the Olympic claims, and additional traverse soil sampling lines on the Sanchez claims. A total of 893 soil samples were collected in two separate surveys. The first survey consisted of 618 talus-fines samples collected and analyzed at the Reliance project site using a portable XRF analyzer (Olympus Vanta pXRF). The second survey consisted of 275 glacial-fluvial till samples collected in a grid pattern over the Enigma Showing (the "Enigma Grid"). The Enigma Grid samples were analyzed by a weak Ionic Leach digestion technique (ALS ME-MS23). Concurrent with the soil sampling programs, samplers collected 19 rock grab samples for assay analysis (ALS Methods Au-ICP21 / ME-MS61) .

The 2023 geochemical surveys identified three geochemical anomalies that are associated with arsenic and gold mineralization. The first anomaly is situated between Girl and Howe creeks, is approximately 500 metres in length, and is defined by pXRF talus-fines and rock grabs. The second anomaly is related to the Enigma Showing and is defined by anomalous arsenic in Ionic Leach samples. The third set of discontinuous linear anomalies are sub-parallel to Howe Creek and are possibly related to interlayered ultramafic rocks and felspar porphyry dykes (see Figure 39).

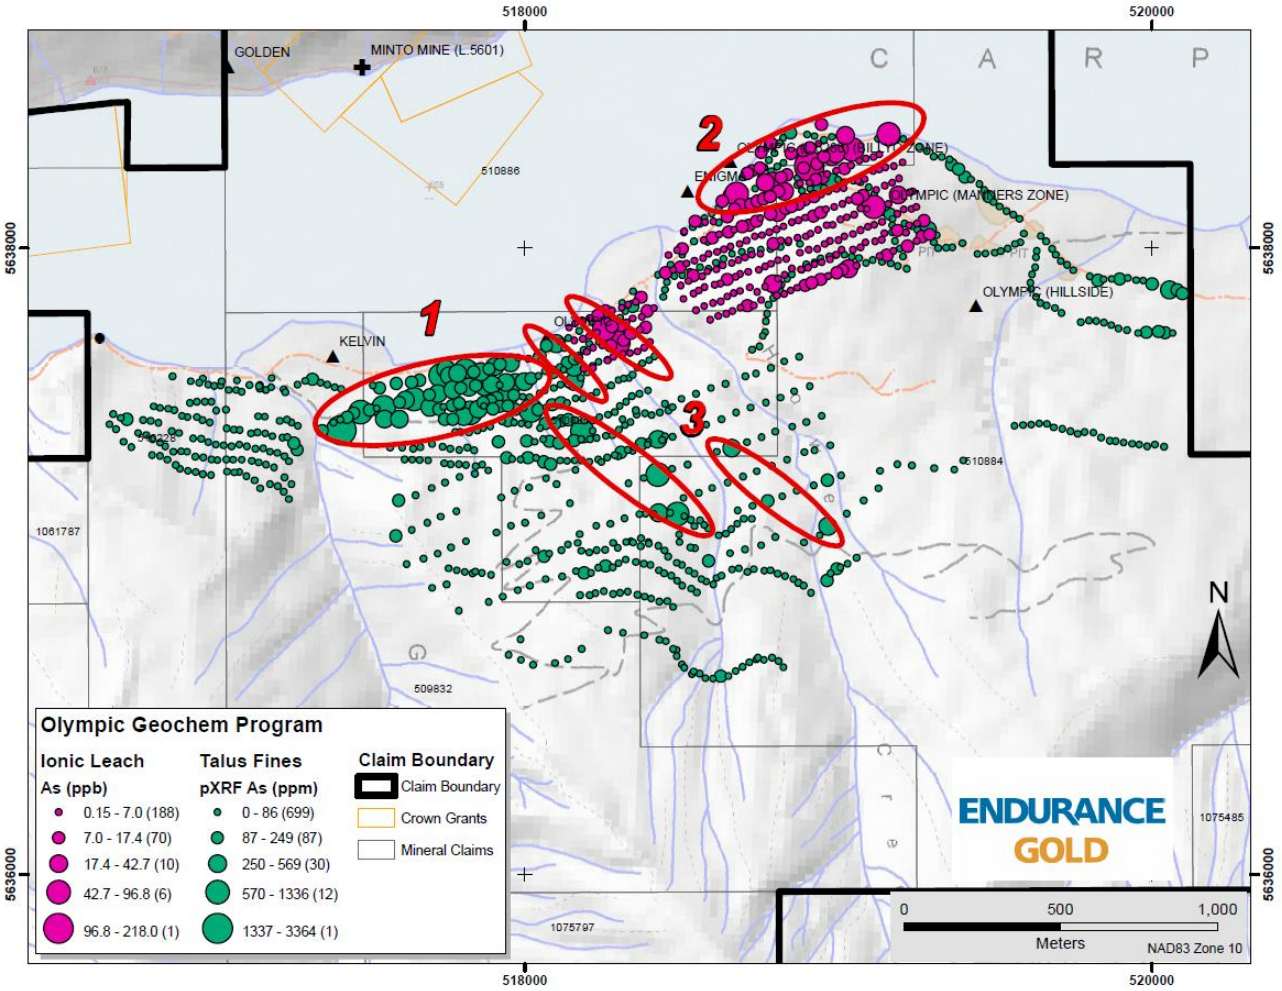
Anomaly #1 (the "Olympic Anomaly") is defined by 99 talus-files samples with an average pXRF arsenic value of 258 ppm, and a maximum value of 3,364 ppm. The anomaly is 650 metres in length and trends sub-parallel to the Bridge River Valley at 075 degrees. The anomaly appears to be truncated by the Girl Creek drainage to the west which hosts the Kelvin MinFile occurrence (MINFILE# 092JNE129). At the east end, the anomaly is possibly truncated or offset at the Howe Creek drainage where feldspar porphyry dykes have been mapped, and ultramafic rocks have been inferred from elevated chromium-nickel-magnesium values in talus-fines.

Anomaly #2 (the "Enigma Anomaly") is defined by 40 Ionic Leach soil samples that returned weak leach arsenic values averaging 24 ppb, and a maximum value of 218 ppb. The anomaly is 500 metres long, trends at 060 degrees, and is also subparallel to the Bridge River Valley. This newly defined trend direction was unexpected. A NW-SE trend parallel to the Howe Creek was expected and hence the Enigma Grid

was not oriented in the optimal direction. The 25-m sample spacing, 50-m line spacing grid loosely defined this new orientation, but further infill sampling is required to better define the anomaly extents. Currently the western extent of the Enigma Anomaly is defined by the original Enigma outcrop displaying strong ankerite alteration and stibnite veining. Approximately 500 metres to the east, the Enigma Anomaly again outcrops on the lakeshore at a previously unrecorded showing (currently nicknamed the 'Maurice Zone'). Further outcrop sampling and geological mapping is required at the 'Maurice Zone'.

Anomaly #3 is a set of discontinuous linear talus-fines anomalies that are sub-parallel to Howe Creek and are possibly related to interlayered ultramafic rocks and felspar porphyry dykes. This anomaly was initially identified in the 2022 program by elevated pXRF arsenic in talus-fines. Further work is required to follow this anomalous trend to the southeast along ultramafic contacts. At the northwest end the anomalies continue to the lake shoreline and interact with the Olympic Anomaly.

Figure 39 Arsenic-in-Soil Anomalies



The 2023 geochemical sampling program was a success at expanding the anomalies identified in the 2022 program and defined new trends of mineralization parallel to the Bridge River Valley. Further infill sampling, prospecting and outcrop mapping is recommended to further define the Olympic and Enigma anomalies. Detailed sampling should be completed to determine if these two anomalies are continuous, or perhaps separated by an offset at the Howe Creek drainage. A series of short RC holes are recommended to collect outcrop samples in areas where there is glacial-fluvial till cover. Outcrop mapping and detailed sampling is recommended to identify any mineralized structures parallel to the Bridge River Valley.

The Howe Creek anomalies require infill sampling and sampling further to the southeast. These anomalies appear to be controlled by ultramafic rocks, so a ground or drone magnetic survey may assist in mapping the trend of ultramafic rocks. Douglas Fir twig sampling has also proven to be effective for mapping arsenic trends along the Royal Shear and a small survey on Olympic in 2022 proved effective. The Douglas Fir biogeochemical survey should also be expanded to test for additional anomalies to the southeast at elevation where there is significant tephra ash cover.

APPENDIX B

STATEMENT OF QUALIFICATIONS

Statement of Qualification

I, Darren O'Brien, P.Geo, do hereby certify the following:

• I am author of this assessment report titled “2023 Geochemical Assessment Report on the Olympic and Sanchez Claims, Reliance Gold Project” dated January 15, 2024 (the “*Assessment Report*”).

• I am a graduate of the University of Alberta (1993) and hold a B.Sc. Degree (Specialization) in Geology.

• In 2001 I obtained an Advanced Diploma in Geographic Information Systems (GIS) from the British Columbia Institute of Technology.

• I am registered as a Professional Geologist with the Engineers & Geoscientists of British Columbia (EGBC), and a former elected director of The Association for Mineral Exploration British Columbia (AMEBC).

• I have worked in my profession as a Geologist for 30 years, both as an employee of major and junior mining companies, and as an independent consultant. I have worked at a variety of mining and exploration projects in Canada, United States, Central Asia and the Caribbean.

• I have been to the Reliance Gold Project numerous times and have been actively managing the project and participating in the exploration work described in this Assessment Report since April 2020.

• I am a consultant and currently an insider of Endurance Gold Corporation, and hold the title Vice President of Exploration.

• I operate under the business name O’Brien Geological Consulting Inc., a business independent of Endurance Gold Corporation.

• The business address of O’Brien Geological Consulting Inc. is 3649 – 153 Street, Surrey, BC, V3Z 0R2.

(signed) “Darren O’Brien”

APPENDIX E

IONIC LEACH ANALYTICAL METHOD DESCRIPTION
(ME-MS23)

ALS Method ME-MS23™

Ionic Leach™

An advancing technology, extracting maximum value from exploration soil, stream and organic-rich sediment samples.

Superior extraction technology and ultra sensitive ICP-MS now delivers sub-ppb (below crustal abundance) detection limits for critical ore and pathfinder elements — allowing for better drill targeting and identification of mineral systems in complex settings.

Chemistry of Mineral Systems

Drill core lithochemistry is now defining subtle but extremely diagnostic element associations and haloes associated with ore systems at depth. The challenge is to identify their fingerprints at surface. Ionic Leach™ is designed to achieve this.

Extracting More From Samples

Increasing restrictions on exploration access has re-focussed attention onto surface geochemical samples, which are arguably the most cost effective samples in exploration. Likewise, the cost of drill campaigns and the need for deeper holes demand improved hole targeting to increase the success rate. This then allows drilling dollars to be spent on drill outs earlier in the exploration, discovery and development cycle.

The need to extract more information from individual soil, stream or organic-rich (e.g. bog, peat) samples, has driven continued development of partial extraction geochemistry. Nano particle science and innovation in analytical instrumentation has complimented research work on mechanisms of ion release, transport and accumulation at surface, resulting in improved analytical methods.

Ionic Leach™ Capability

Ionic Leach™ is specifically designed to detect subtle but diagnostic element responses at surface that can characterise large mineral systems near surface and at depth. The element suite incorporates both commodity elements and key pathfinders from a single analysis that are diagnostic of precious and base metal, uranium, REE's, PGE, diamond and Sn, Ta, Li systems.

The method also routinely delivers responses for I and Br, pathfinders not detected by conventional soil analyses. The ability to reliably report these and other pathfinders enhances the techniques capability to identify metal zonation within, and haloes surrounding mineral systems. Geological signatures and alteration zonation can often be defined.

Ionic Geochemistry

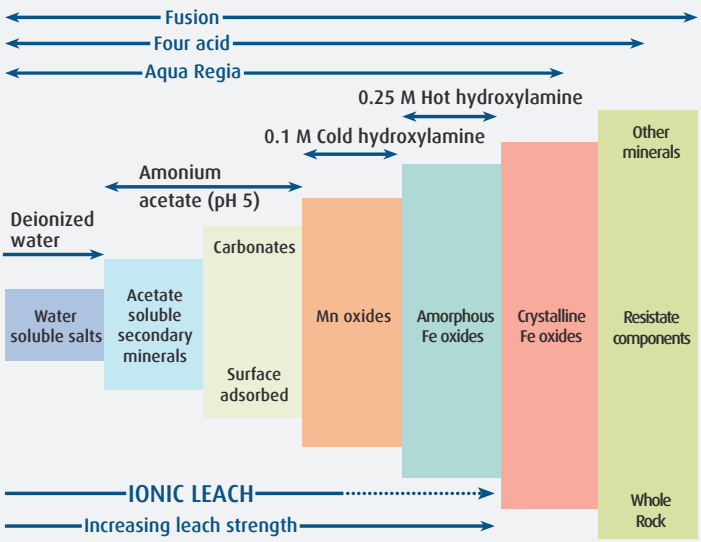
A growing body of research confirms that ionic element species are mobile. This allows elements released at depth to be mobilised to the surface where these loosely bound ions can be measured.

The mobility of ions is strongly controlled by the pH conditions present in the soil. Therefore, a good understanding of the soil pH variation, both with depth and across the sampling area, is recomended for understanding the mobility of ions in a program.

Advantages

- Low detection limits allowing characterisation of background for greater confidence in subtle anomalies.
- Multi-species ionic fingerprints can define and rank drill targets reducing wasted drill meters.
- Define targets in complex mineral settings, new mineral systems and regional corridors.
- Applicable in a wide range of landscapes, regolith settings and climatic conditions.
- Sampling is fast and efficient with low impact culturally and environmentally.
- Cost-effective field exploration where access is restricted for ground disturbing activities.

Leach Method and Target Mineralogy



Ionic Leach™ — Minimal processing and ultra low detection limits revolutionise partial extraction geochemistry for surface samples.

Ionic Leach™ Background

This innovative partial extraction technique for surface samples relies on complexing agents to selectively extract and hold ionic species from soil, stream and organic rich sediment samples in the leachant solution.

Samples are extracted as collected in isolated, purpose built facilities using equipment and protocols that eliminate contamination or loss in samples.

The leachant solution is introduced directly to the ICP-MS instrument. Using advanced sample introduction technology the ultra low sub-ppb detection limits routinely achieve 'natural background' levels thereby enhancing 'signal to noise' ratios. This helps identify often subtle, but significant responses from mineralisation, geology and alteration that can be diagnostic of numerous mineral systems.

Ionic Leach™ offers a package of 61 elements under code ME-MS23™ and Pb isotopes under code MS23-PbIS™.

Ionic Leach™ Method

A 50g sample is used with no pre-treatment: samples are collected directly from the field bags. The lack of drying and sieving significantly reduces the possibility of contamination and processing occurs in a dedicated ionic preparation laboratory. The sample to reagent ratio is 1:1 thereby eliminating dilution prior to analysis. This allows very low detection limits to be achieved.

Sampling

The following list summarise the sample packaging protocols specific for ionic leach:

- 120 g of sample is collected and placed in a 'snap seal' or 'ziplock' plastic bag with the sample number written in permanent marker on the bag.
- The bag is folded over, removing most of the air and sealed. Then the bag is placed in another plastic bag, again removing as much air prior to sealing - double bag the sample.
- With dry soils a plastic sieve between 2-5 mm can be used to collect the sample. In wet conditions, pick out larger stones and place residual material directly in the bag.
- Remove jewelery and only use plastic implements, shovels and picks. Picks should be cleaned of any paint or coatings.
- ALS always recommends an orientation survey to assess the advantages of Ionic Leach™ for any sampling program in specific exploration areas, particularly where sampling may be difficult.

ME-MS22, ME-MS23
pH Controlled Ionic Leach With ICP-MS Finish

Sample Decomposition:

Ionic leach (SEL-ION)

Analytical Method:

Inductively Coupled Plasma - Mass Spectrometry (ICP-MS)

Ionic Leach is a static sodium cyanide leach using chelating agents ammonium chloride, citric acid and EDTA with the leachant buffered at pH 8.5.

Note: Method code ME-MS23 reports all analytes in the table. To pick select analytes use method code ME-MS22.

QC CERTIFICATE VA23149914

Project: Reliance Gold

P.O. No.: Olympic 2023--002

This report is for 275 samples of Soil submitted to our lab in Vancouver, BC, Canada on 2-JUN-2023.

The following have access to data associated with this certificate:

ROBERT BOYD	TERESA CHENG	DARREN OBRIEN

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-MS23	IONIC Leach - Complete PKG.	ICP-MS
pH-MS23	MS23 Leach pH	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

Boudinaged qtz with fine dark material as matrix around stretched clasts. Float with the same light powder green alteration noted in shears at Enigma. Increased darker green basalt boulders with more serpentinized look. Zone is beside a creek with fine talus bluffs on either side with not OC exposure to the east. Guessing host is the sheared basalt. Serpentinized float material is dark green to black, chl alt'd and waxy when scratched. oxidized on some surfaces and 2<3mm planar gray translucent qtz veins present. Some veins have milky white rims with grey interior. Structure at sample H614458 < qtz vein in OC to possible subcrop with silicified basalt. Vein at 312/82 parallel to major fracture. Sampled very brown red and yellow oxidized fault gouge. Fault at 136/84	0.281	1.96	1.52	3120	30	<0.05	4.02	0.22	16.45	0.28	56.5	3410	2.16	948	25.6	5.31	0.14	<0.1	1.18	0.1	<0.5	7	0.63	139	0.72	0.03	0.1	395	30	31.7	2.9	<0.002	0.12	31.6	3.1	2	0.2	13.8	<0.05	0.51	0.04	0.018	<0.02	0.1	40	2.8	0.2	909	0.7
H614459	Rock Grab	Katie Dodd	2023	2023-05-17	Olympic	NAD83_10N	518057	5637706	668	Oxidized serpentine sheared material wrapping around blocky more competent basaltic block in shear zone. Rock face to the west has later SW dipping fractures/veins at 160/48 which roughly parallel the top of the shear as it wraps around the basaltic block. Lower part of the shear is 012/76. Fine dis py about 5% in mafic blocky lenses with 2<4mm translucent white qtz veins, powder green oxide, mnox. Sampled oxidized shear material at 12/76. Vuggy rusty 1<1.5cm vein with 1.1% Cu via XRF. Rusty vein gouge material runs for copper and As. Qtz bleb with anterite on fracture surfaces and 1<2% dis py did not run for significant Cu. Appears material around qtz is the mineralized material.	0.061	0.57	2.91	1055	20	0.07	0.51	1.44	68.4	0.91	159	2820	1.73	3100	7.85	4.46	0.09	0.1	1.68	0.05	0.5	7	15.35	1080	1.02	0.02	0.1	1715	30	5.3	2.3	<0.002	0.51	116	15.8	<1	0.4	10	<0.05	0.35	0.08	0.03	0.02	0.2	52	4.7	1.6	5120	2

CERTIFICATE VA23145893

Project: Reliance Gold

P.O. No.: Olympic-2023-001

This report is for 19 samples of Rock submitted to our lab in Vancouver, BC, Canada on 30-MAY-2023.

The following have access to data associated with this certificate:

ROBERT BOYD	TERESA CHENG	DARREN OBRIEN

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-OG62	Ore Grade Elements - Four Acid	ICP-AES
Zn-OG62	Ore Grade Zn - Four Acid	
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
Au-GRA21	Au 30g FA-GRAV finish	WST-SIM
ME-MS61	48 element four acid ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: REEs may not be totally soluble in this method.
ME-MS61

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
