Conclusions and The Future

1. An outstanding New Exploration Discovery in an historically productive multi-million ounce Orogenic Gold Camp.

2. Wide pervasive iron-carbonate sericite alteration, sulphidization, breccia, and antimony indicate an “Epizonal” Orogenic setting in a “brittle” structural regime – Epizonal comparables to Fosterville, Australia and recent Newfoundland discoveries.

3. Model provides potential for a major gold system with depth continuity.

4. RC & DDH Drilling has delivered a high percentage of significant and excellent intersections.

5. The Eagle Zone is now over 500 m – New steeper Feeder intersections at Eagle South indicate >400 m trend – open at depth

6. Diamond Drilling Results Pending on 16 drill holes

7. New targets acquired in April 2022
