24 of 82 holes > 50 gram x m

RC Success Statistics

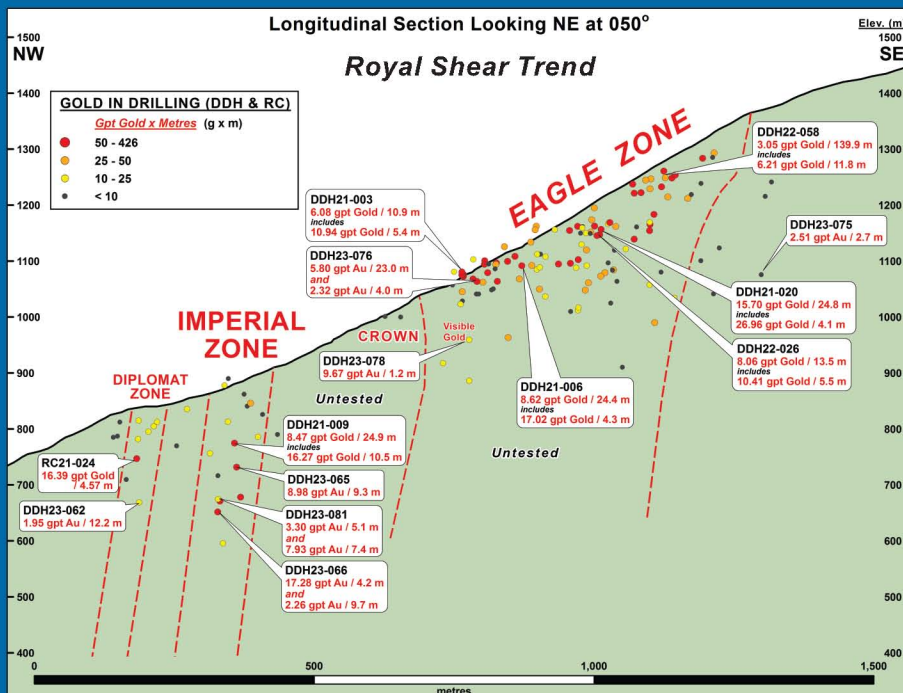

Most holes have significant intersections

Gold mineralized zones and the majority of drill intersections < 75 m below surface.

Associated with multi-phase mineralized breccia.

Homogeneously mineralized over wide drilled intervals between 3 and 30 m.

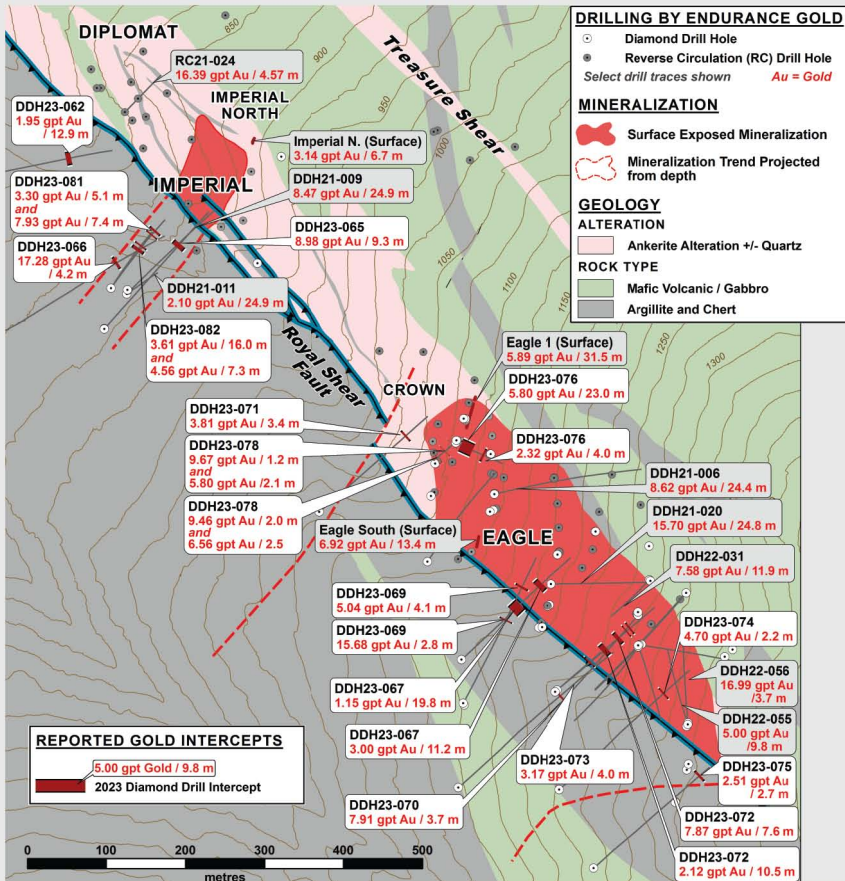

Indicates potential to be amenable to lower unit-cost mining methods.

Orogenic Gold (Option 100%)

- 10 km NE of Bralorne - Pioneer Mine with +4 million ounces of gold production from camp.
- An Epizonal (shallower) equivalent of the Bralorne Orogenic Camp.
- Mineralization is related to silicification and sulphidization in a wide sericite - ankerite alteration zone along the regional Royal Shear over at least 2 km strike length and 600 m vertically.
- Multiple road accessible sub-parallel structural host targets.
- Eagle Zone 550 x 150 m area averaging 5.17 gpt Gold over 9.6 m in over 70 RC & DDH

Significant gold-bearing drill intersections confirmed over 1.5 km of the structural trend associated with favourable alteration
